

Bruksanvisning i original

S akerhetsrel  RT9

Vill du ha ett litet s akerhetsrel  f r alla skydd?

I s  fall ska du v lja det lilla universalrel  RT9 som kan  vervaka b de skyddsanordningar och den interna s kerheten i en maskin. Dessutom kan du v lja den s kerhetsniv  som  nskas vid respektive installation. Detta tack vare att RT9 har de flesta av de ing ngsvariabler som finns p  marknaden. RT9 kan d rfor ers tta m nga andra rel er.

Andra valm glichheter p  RT9  r manuell eller automatisk  terst llning. Manuellt  vervakad  terst llning anv nds f r grindar och andra skydd som kan passeras. Automatisk  terst llning kan anv ndas f r sm  s kerhetsluckor om det  r l mpligt ur riskynpunkt.

Ut ver detta har RT9 en dubbel informationsutg ng som talar om att en grind har  ppnats samt om skyddet har  terst llts.

RT9  r byggt med modern och rationell teknik vilket g r att vi kan h lla kostnaderna l ga b de vid produktion och komponentk st.

V r RT9 d  kommer att f reklina dina s kerhetskr v och minska dina kostnader.

Teknisk information - RT9

Ing ngarna fr n skyddsanordningar ska anslutas enligt n got av exemplet nedan f r att uppfylla f rl ngd s kerhetsniv  samt f r att undvika os kra situationer.

RT9 kan konfigureras f r drift i n got av f ljande inkopplingsalternativ:

1. Enkanal, 1 NO kontakt fr n +24 VDC, s kerhetskategori 1 PL c.
2. Tv kanal, 2 NO kontakter fr n +24 VDC, s kerhetskategori 3 PL d.
3. Tv kanal, 1 NO, 1 NC kontakt fr n +24 VDC, s kerhetskategori 4 PL e.
4. Tv kanal, 1 NO kontakt fr n 0 V och 1 NO kontakt fr n +24 VDC, s kerhetskategori 4 PL e.
5. Kontaktmatta/bumperkl mist. 1 "kontakt" fr n 0 V och 1 "kontakt" fr n +24 VDC, s kerhetskategori 3 PL d.

N r ing ngen/ing ngarna  r aktiverade och n r test/ vervakad  terst llning  r klar aktiveras rel  1 och 2. Dessa faller n r ing ngarna deaktiveras enligt valt ing ngsalternativ eller vid energibrottl. Rel  1 och 2 m ste b da falla innan utg ngarna kan aktiveras igen.

Rel utg ng f r statusinformation
RT9 har en rel utg ng med dubbel information som kan kopplas till en PLC, dator eller liknande. Denna utg ng ger information om rel ets status.

 terst llning och test
RT9 har tv  ing ngsalternativ f r  terst llning: manuell respektive automatisk. Manuellt  vervakad  terst llning anv nds vid skydd som kan passeras, dvs. f r att s kerst lla att ing  s kerhetsrel ets utg ngar sl ts bara f r att en grind st ngs. I  vriga fall kan automatisk  terst llning anv ndas om det  r till tet ur s kerhetsynpunkt.

Dessutom klarar RT9 automatisk  terst llning oavsett stigtid p  driftsp nningen vilket  r viktigt n r stora laster startas upp samtidigt.

RT9 kan ocks  testa ( vervaka) att t ex kontaktorer och ventiler har fallit/ terg tt innan ny start till ts.

Indikering om undersp nning

Om driftsp nningen sjunker under rekommenderad niv  indikeras detta genom att lysdioden f r man vervakning  verg r fr n fast sken till blinkande. Detta intr ffar ocks  vid p verkad kontaktmatta/bumperkl mist. Se inkopplingsalternativ 5.

S kerhetsniv 

RT9 har internt dubbelrad och  vervakad skyddsfunktion. Varken kortslutning, intern komponentfel eller yttre st rningar ger f rllig funktion f r alternativen med h gsta s kerhetsniv . Manuell  terst llning inneb r att ing ngen f r  terst llning m ste slutas och  ppnas innan s kerhetsrel ets utg ngar kan aktiveras. D rigenom  vervakas kortslutning och fel p   terst llningsknapp.

N r RT9 anv nds tv kanaligt,  vervakas att b da ing ngarna  terg tt f r varje varje ny start.

Den h gsta s kerhetsniv n har ing ngsalternativ 3 och 4 eftersom alla kortslutningar och avbrott  vervakas. Detta i kombination med intern str mbegr nsning g r att rel et  ven passar utm rkt f r  vervakning av kontaktmattor, kl mister och bumpers.

Inkopplings exempel
Exempel p  hur v ra s kerhetsrel er l ser olika s kerhetsproblem finner du nedan.

F reskrifter och standarder

RT9  r konstruerad och godk nd enligt till mpliga standarder i Sverige och utomlands. Se Tekniska data.

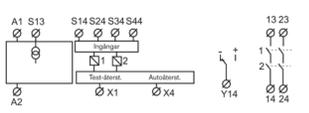

Installationsf reskrifter

S kerhetsrel er och andra enheter ska installeras av beh rig elektriker i enlighet med s kerhetsf reskrifter, angivna standarder och Maskindirektivet. Alla s kerhetsfunktioner m ste testas innan systemet startas.

Aktas! N tsp nningen till systemet ska st ngas av f re installation, modifiering eller andra justeringar som kan  ventyra s kerheten i systemet.

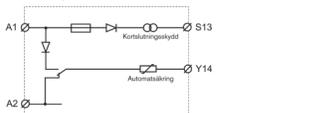

Underh ll

S kerhetsfunktionerna ska testas regelbundet, minst en g ng per  r, f r att kontrollera att samtliga av dem fungerar som de ska.

Inkoppling av matning - RT9

DC-matning

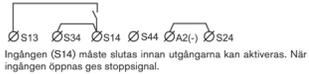

RT9 ska matas med +24 V p  A1 och 0 V p  A2.

NOTERA!
Anslut sk rmd kabel m ste denna kopplas till jordseks eller motsvarande jordpunkt.

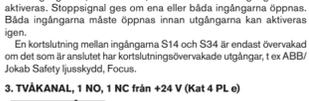

Inkoppling av skydd - RT9

1. ENKANAL, 1 NO fr n +24 V (Kat 1 PL c)

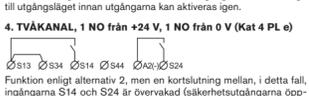

Ing ngen (S14) m ste slutas innan utg ngarna kan aktiveras. N r ing ngen  ppnas ges stoppsignal.

2. TV KANAL, 2 NO fr n +24 V (Kat 3 PL d)

B da ing ngarna (S14 och S34) m ste slutas innan utg ngarna kan aktiveras. Stoppsignal ges om ena eller b da ing ngarna  ppnas. B da ing ngarna m ste  ppnas innan utg ngarna kan aktiveras igen.

3. TV KANAL, 1 NO, 1 NC fr n +24 V (Kat 4 PL e)

En ing ng m ste slutas (S14) och en m ste  ppnas (S44) innan utg ngarna kan aktiveras.

Stoppsignal ges om en eller b da ing ngarna  ndras tillst nd samt vid kortslutning mellan S14 och S44. B da ing ngarna m ste  terg tt till utg ngslaget innan utg ngarna kan aktiveras igen.

4. TV KANAL, 1 NO fr n +24 V, 1 NO fr n 0 V (Kat 4 PL e)

Funktion enligt alternativ 2, men en kortslutning mellan i, detta fall, ing ngarna S14 och S24  r  vervakad (s kerhetsutg ngarna  ppnas).

5. Kontaktmatta/bumperkl mist (Kat 3 PL d)

B da ing ngarna, vid  paverkad kl mist/bumper/matta, m ste vara sluta f r att ing ngarna ska kunna aktiveras. Vid p verkad kl mist/bumper/matta eller kortslutna kanaler (S14-S24) faller rel erna och lysdioden f r matningssp nning "ON" b rjar blinka. D  utg ng S13  r str mbegr nsad till 70 mA  verlastas inte RT9 n r kontakt uppst r i kl mist, bumper eller matta.

Inkoppling av  terst llning - RT9

Manuellt  vervakad  terst llning kopplas in p  ing ng X1 som b de m ste slutas och  ppnas innan utg ngsrel erna kan aktiveras.

Automatisk  terst llning

Automatisk  terst llning v ljs genom att en bygel l ggs mellan A1(+), X1 och X4. Rel utg ngarna aktiveras d  samtidigt som ing ngarna.

Tekniska data - RT9

Fabrikat	ABB AB/Jokab Safety, Sverige
Artikelnr./best�llningsdata	RT9 24DC 2TLA010029R000
F�rg	Gr�
Vikt	210 g
Driftsp�nning	24 VDC ±20%
Effektf�rbrukning	2 W
Normalt sp�nning	2 W
Anslutning S13	Kortslutnings-s�ker sp�nningsutg�ng 70 mA ±10% str�mbegr�nsning. Anv�nds till ing�ngarna S14, S34 och S44.

Original manual

Safety relay RT9

Would you like a small safety relay for all your applications?

Then choose the compact RT9 universal relay to supervise both your safety devices and the internal safety of your machinery. In addition, you can select the safety level for each installation. All this is possible due to the RT9 offering the most versatile input option arrangement available on the market. The RT9 can therefore replace many other relays.

Other RT9 options include selection of either manual supervised or automatic resetting. The manual supervised reset can be used for gates and other safety devices that are bypassed. Automatic reset can be used for small safety hatches, if deemed acceptable from risk assessment.

In addition, the RT9 has a double information output that will indicate e.g. if a gate is open or if the relay needs resetting. The RT9 uses the latest component technology and modern assembly techniques to ensure a highly cost effective solution.

Choose the RT9 to simplify your safety circuits and reduce your costs.

Technical information - RT9

Inputs
The inputs from the safety devices must be connected according to one of the following options in order to fulfill the expected safety level and to avoid unsafe situations.

The RT9 can be configured to operate in either of the following input options:

1. Single channel, 1 NO contact from +24 VDC, safety cat. 1 PL c.
2. Dual channel, 2 NO contacts from +24 VDC, safety cat. 3 PL d.
3. Dual channel, 1 NO, 1 NC contact from +24 VDC, safety cat. 4 PL e.
4. Dual channel, 1 NO contact from 0 V and 1 NO contact from +24 VDC, safety cat. 4 PL e.
5. Safety mat/contact strips, 1 'contact' from 0 V and 1 'contact' +24 VDC, safety cat 3 PL d.

When the input/inputs are activated and the test/supervised reset is complete, relays 1 and 2 are energised. These are de-energised when the input/inputs are de-activated in accordance with the input option chosen or in case of a power failure.

Relays 1 and 2 must both be in accordance with the RT9 can be reset.

Relay output status information
The RT9 has a changeover contact relay output that can be connected to a PLC, control lamp, computer or similar. The output gives information about the status of the relay.

Reset and testing

The RT9 has two reset options; manual and automatic. The manual supervised reset can be used when the RT9 is monitoring safety devices that can be bypassed, i. e. to ensure that the outputs of the safety device do not close just because a gate is closed. The automatic reset option should only be used if appropriate from a risk point of view.

Due to special internal circuits the RT9 can be automatically reset regardless of the operational voltage rise time, this being an important factor when large loads are started up on the same power supplies at the same time.

In addition, the RT9 can also test (supervise), if for example, contactors and valves etc are de-energised/ds-activated before a restart is made.

Indication of low voltage

The "On" LED will flash if the relay supply voltage falls below an acceptable level. This indication will also be given if a monitored safety mat/contact strip is activated. Please see Connection option 5.

Safety level

The RT9 has internal dual and supervised safety functions. Power failure, an internal faulty component or external interference will not present a risk to connection options with the highest safety level. A manual reset requires that the reset input is closed and opened before the safety relay outputs are activated. A short-circuit or a faulty reset button is consequently supervised.

When the RT9 is configured for dual channel input, both the inputs are supervised for correct operation before the unit can be reset. The input options 3 and 4 have the highest safety levels as all short-circuits and power failures are supervised. This in combination with an internal current limitation makes the relay ideal for supervision of safety mats and contact strips.

Connection examples

For examples on how our safety relays can solve various safety problems, please see the connection examples below.

Regulations and standards

The RT9 is designed and approved in accordance with appropriate directives and standards. See Technical data.

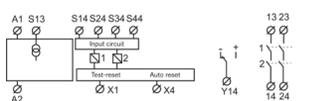

Installation precautions

The safety relay and devices shall be installed by a trained electrician following the Safety regulations, standards and the Machinery directive. All the safety functions shall be tested before the starting up of the system.

Caution: The main voltage for the system should be switched off before installation, modifications or other adjustments are made that can risk the safety of the system.

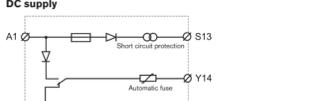

Maintenance

The safety functions shall be tested periodically, at least once per year to confirm that all the safety functions are working properly.

Connection of supply - RT9

DC supply

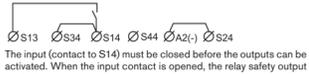

The RT9 should be supplied with +24 V on A1 and 0 V on A2.

NOTE!
If cable shielding is used this must be connected to an earth rail or an equivalent earth point.

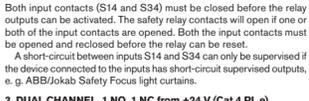

Connection of safety devices - RT9

1. SINGLE CHANNEL, 1 NO from +24 V (Cat 1 PL c)

The input (contact to S14) must be closed before the outputs can be activated. When the input contact is opened, the relay safety output contacts open.

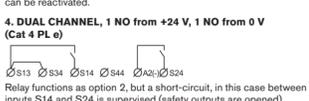

2. DUAL CHANNEL, 2 NO from +24 V (Cat 3 PL d)

Both input contacts (S14 and S34) must be closed before the relay outputs can be activated. The safety relay contacts will open if one or both of the input contacts are opened. Both the input contacts must be opened and reclosed before the relay can reset.

A short-circuit between inputs S14 and S34 can only be supervised if the device connected to the inputs has short-circuit supervised outputs, e.g. ABB/Jokab Safety Focus light curtains.

3. DUAL CHANNEL, 1 NO, 1 NC from +24 V (Cat 4 PL e)

One input contact must be closed (S14) and one opened (S44) before the relay outputs can be activated.

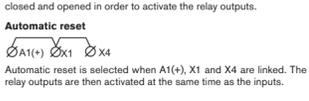

The safety relay contacts will open if one or both of the input change state or in case of a short-circuit between S14 and S44. Both inputs must be returned to their initial status before the relay outputs can be reactivated.

4. DUAL CHANNEL, 1 NO from +24 V, 1 NO from 0 V (Cat 4 PL e)

Relay functions as option 2, but a short-circuit, in this case between inputs S14 and S24 is supervised (safety outputs are opened).

5. Safety mat/Contact strip (Cat 3 PL d)

Both "contact" inputs from a inactivated safety mat/contact strip must be made in order to allow the RT9 relay outputs to be activated. When the safety mat/contact strip is activated or a short-circuit is detected across S14-S24, the relay will de-energise (safety contacts open) and the "ON" LED will flash. As output S13 has an internal current limit of 70 mA, the RT9 will not be overloaded when the mat/contact strip is activated or a short-circuit is detected.

Reset connections - RT9

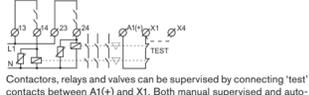

Manual supervised reset

The manual supervised reset contact connected to input X1 must be closed and opened in order to activate the relay outputs.

Automatic reset

Automatic reset is selected when A1(+), X1 and X4 are linked. The relay outputs are then activated at the same time as the inputs.

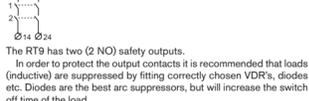

Testing external contactor status

Contactors, relays and valves can be supervised by connecting 'test' contacts between A1(+) and X1. Both manual supervised and automatic reset can be used.

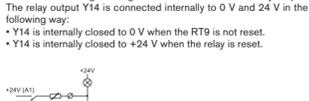

Output connections - RT9

Relay outputs

The RT9 has two (2) NO safety outputs. In order to protect the output contacts it is recommended that loads (inductive) are suppressed by fitting correctly chosen VDRs, diodes etc. Diodes are the best arc suppressors, but will increase the switch off time of the load.

Information outputs

The RT9 has a single changeover contact information relay output. The relay output Y14 is connected internally to 0 V and 24 V in the following way:

- Y14 is internally closed to 0 V when the RT9 is not reset.
- Y14 is internally closed to +24 V when the relay is reset.

Caution: This product shall be handled with caution: The product should be replaced with the same product type in a situation where it has been dropped on the floor, knocked struck, exposed to extreme voltages, temperatures or humidity under the specified limits.

In case of functional problems: Test the safety functions and devices. The entire system should be tested without disconnecting the power supply. Check that the LED indicators for "In 1" and "In 2" go On or Off when the input-devices are On or Off respectively. Both must light before the unit start at Auto-reset or Manual-reset. After a restart all five LEDs should light. These LEDs are described in the Technical data section. In case of a problem with the unit, check the LED status and inspect the appropriate part of the system. Take measurements where necessary. If the problem is not solved, please contact the nearest ABB/Jokab Safety Service Office or dealer.

Technical data - RT9

Manufacturer	ABB AB/Jokab Safety, Sweden
Article number/Ordering data	RT9 24DC 2TLA010029R000
Colour	Grey
Weight	210 g
Supply Voltage (A1-A2)	24 VDC ±20%
Power consumption	2 W
Connection S13	Short-circuit protected voltage output 70 mA ±10% current limitation. Is used for the inputs S14, S34 and S44.
