## 1 Notes about this Documentation

## Note

#### Always retain this documentation!

This documentation is part of the product. Therefore, retain the documentation during the entire service life of the product. Pass on the documentation to any subsequent user. In addition, ensure that any supplement to this documentation is included, if necessary.

## 1.1 Validity of this Documentation

This documentation is only applicable to the "ETHERNET Fieldbus Coupler" (750-352) and the variants listed in the table below.

Tabelle 1: Variations

| Oder number/<br>Variation | Designation   |
|---------------------------|---|
| 750-352                   | ETHERNET Fieldbus Coupler   |
|                           | Default protocol Ethernet/IP, Modbus is deactivated,<br>Default IP address: 10.1.0.0ETHERNET Fieldbus Coupler |

## Note

#### **Documentation Validity for Variants**

Unless otherwise indicated, the information given in this documentation applies to listed variants.

The product "ETHERNET Fieldbus Coupler" (750-352) shall only be installed and operated according to the instructions in this manual and the system description for the WAGO-I/O-SYSTEM 750.

## NOTICE

#### Consider power layout of the WAGO-I/O-SYSTEM 750!

In addition to these operating instructions, you will also need the system description for the WAGO-I/O-SYSTEM 750, which can be downloaded at <a href="https://www.wago.com">www.wago.com</a>. There, you can obtain important information including information on electrical isolation, system power and supply specifications.

## 1.2 Copyright

This Manual, including all figures and illustrations, is copyright-protected. Any further use of this Manual by third parties that violate pertinent copyright provisions is prohibited. Reproduction, translation, electronic and phototechnical filing/archiving (e.g., photocopying) as well as any amendments require the

written consent of WAGO Kontakttechnik GmbH & Co. KG, Minden, Germany. Non-observance will involve the right to assert damage claims.

## 1.3 Symbols

## **▲ DANGER**

#### Personal Injury!

Indicates a high-risk, imminently hazardous situation which, if not avoided, will result in death or serious injury.

## **▲ DANGER**

#### **Personal Injury Caused by Electric Current!**

Indicates a high-risk, imminently hazardous situation which, if not avoided, will result in death or serious injury.

## **⚠ WARNING**

#### Personal Injury!

Indicates a moderate-risk, potentially hazardous situation which, if not avoided, could result in death or serious injury.

## **△ CAUTION**

#### Personal Injury!

Indicates a low-risk, potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

## NOTICE

#### Damage to Property!

Indicates a potentially hazardous situation which, if not avoided, may result in damage to property.

## NOTICE

#### Damage to Property Caused by Electrostatic Discharge (ESD)!

Indicates a potentially hazardous situation which, if not avoided, may result in damage to property.

## Note

#### **Important Note!**

Indicates a potential malfunction which, if not avoided, however, will not result in damage to property.

## Information

#### **Additional Information:**

Refers to additional information which is not an integral part of this documentation (e.g., the Internet).

## 1.4 Number Notation

Table 2: Number Notation

| <b>Number Code</b> | Example     | Note                                      |
|--------------------|-------------|---|
| Decimal            | 100         | Normal notation                           |
| Hexadecimal        | 0x64        | C notation                                |
| Binary             | '100'       | In quotation marks, nibble separated with |
| ,                  | '0110.0100' | dots (.)                                  |

## 1.5 Font Conventions

Table 3: Font Conventions

| <b>Font Type</b> | Indicates  |
|------------------|--|
| italic           | Names of paths and data files are marked in italic-type.               |
|                  | e.g.: C:\Program Files\WAGO Software                                   |
| Menu             | Menu items are marked in bold letters.                                 |
|                  | e.g.: Save   |
| >                | A greater-than sign between two names means the selection of a         |
|                  | menu item from a menu.   |
|                  | e.g.: File > New   |
| Input            | Designation of input or optional fields are marked in bold letters,    |
|                  | e.g.: Start of measurement range                                       |
| "Value"          | Input or selective values are marked in inverted commas.               |
|                  | e.g.: Enter the value "4 mA" under <b>Start of measurement range</b> . |
| [Button]         | Pushbuttons in dialog boxes are marked with bold letters in square     |
|                  | brackets.  |
|                  | e.g.: [Input]  |
| [Key]            | Keys are marked with bold letters in square brackets.                  |
|                  | e.g.: [F5]   |

## 2 Important Notes

This section includes an overall summary of the most important safety requirements and notes that are mentioned in each individual section. To protect your health and prevent damage to devices as well, it is imperative to read and carefully follow the safety guidelines.

## 2.1 Legal Bases

#### 2.1.1 Subject to Changes

WAGO Kontakttechnik GmbH & Co. KG reserves the right to provide for any alterations or modifications that serve to increase the efficiency of technical progress. WAGO Kontakttechnik GmbH & Co. KG owns all rights arising from the granting of patents or from the legal protection of utility patents. Third-party products are always mentioned without any reference to patent rights. Thus, the existence of such rights cannot be excluded.

#### 2.1.2 Personnel Qualifications

All sequences implemented on WAGO-I/O-SYSTEM 750 devices may only be carried out by electrical specialists with sufficient knowledge in automation. The specialists must be familiar with the current norms and guidelines for the devices and automated environments.

All changes to the coupler or controller should always be carried out by qualified personnel with sufficient skills in PLC programming.

# 2.1.3 Use of the WAGO-I/O-SYSTEM 750 in Compliance with Underlying Provisions

Fieldbus couplers, fieldbus controllers and I/O modules found in the modular WAGO-I/O-SYSTEM 750 receive digital and analog signals from sensors and transmit them to actuators or higher-level control systems. Using programmable controllers, the signals can also be (pre-) processed.

The devices have been developed for use in an environment that meets the IP20 protection class criteria. Protection against finger injury and solid impurities up to 12.5 mm diameter is assured; protection against water damage is not ensured. Unless otherwise specified, operation of the devices in wet and dusty environments is prohibited.

Operating the WAGO-I/O-SYSTEM 750 devices in home applications without further measures is only permitted if they meet the emission limits (emissions of interference) according to EN 61000-6-3. You will find the relevant information in the section "Device Description" > "Standards and Guidelines" in the manual for the used fieldbus coupler/controller.

Appropriate housing (per 2014/34/EU) is required when operating the WAGO-I/O-SYSTEM 750 in hazardous environments. Please note that a prototype test certificate must be obtained that confirms the correct installation of the system in a housing or switch cabinet.

#### 2.1.4 Technical Condition of Specified Devices

The devices to be supplied ex works are equipped with hardware and software configurations, which meet the individual application requirements. WAGO Kontakttechnik GmbH & Co. KG will be exempted from any liability in case of changes in hardware or software as well as to non-compliant usage of devices.

Please send your request for modified and new hardware or software configurations directly to WAGO Kontakttechnik GmbH & Co. KG.

## 2.2 Safety Advice (Precautions)

For installing and operating purposes of the relevant device to your system the following safety precautions shall be observed:

## DANGER

#### Do not work on devices while energized!

All power sources to the device shall be switched off prior to performing any installation, repair or maintenance work.

## DANGER

# Install the device only in appropriate housings, cabinets or in electrical operation rooms!

The WAGO-I/O-SYSTEM 750 and its components are an open system. As such, install the system and its components exclusively in appropriate housings, cabinets or in electrical operation rooms. Allow access to such equipment and fixtures to authorized, qualified staff only by means of specific keys or tools.

## NOTICE

#### Replace defective or damaged devices!

Replace defective or damaged device/module (e.g., in the event of deformed contacts), since the long-term functionality of device/module involved can no longer be ensured.

## NOTICE

# Protect the components against materials having seeping and insulating properties!

The components are not resistant to materials having seeping and insulating properties such as: aerosols, silicones and triglycerides (found in some hand creams). If you cannot exclude that such materials will appear in the component environment, then install the components in an enclosure being resistant to the above-mentioned materials. Clean tools and materials are imperative for handling devices/modules.

## NOTICE

#### Clean only with permitted materials!

Clean soiled contacts using oil-free compressed air or with ethyl alcohol and leather cloths.

## **NOTICE**

#### Do not use any contact spray!

Do not use any contact spray. The spray may impair contact area functionality in connection with contamination.

## **NOTICE**

#### Do not reverse the polarity of connection lines!

Avoid reverse polarity of data and power supply lines, as this may damage the devices involved.

#### NOTICE

## Avoid electrostatic discharge!

The devices are equipped with electronic components that may be destroyed by electrostatic discharge when touched. Please observe the safety precautions against electrostatic discharge per DIN EN 61340-5-1/-3. When handling the devices, please ensure that environmental factors (personnel, work space and packaging) are properly grounded.

## 2.3 Special Use Conditions for ETHERNET Devices

If not otherwise specified, ETHERNET devices are intended for use on local networks. Please note the following when using ETHERNET devices in your system:

- Do not connect control components and control networks to an open network such as the Internet or an office network. WAGO recommends putting control components and control networks behind a firewall.
- Limit physical and electronic access to all automation components to authorized personnel only.
- Change the default passwords before first use! This will reduce the risk of unauthorized access to your system.
- Regularly change the passwords used! This will reduce the risk of unauthorized access to your system.
- If remote access to control components and control networks is required, use a Virtual Private Network (VPN).
- Regularly perform threat analyses. You can check whether the measures taken meet your security requirements.
- Use "defense-in-depth" mechanisms in your system's security configuration to restrict the access to and control of individual products and networks.

## 3 System Description

The WAGO-I/O-SYSTEM 750 is a modular, fieldbus-independent input/output system (I/O system). The configuration described here consists of a fieldbus coupler/controller (1) and the modular I/O modules (2) for any signal shapes that form the fieldbus node together. The end module (3) completes the node and is required for correct operation of the fieldbus node.

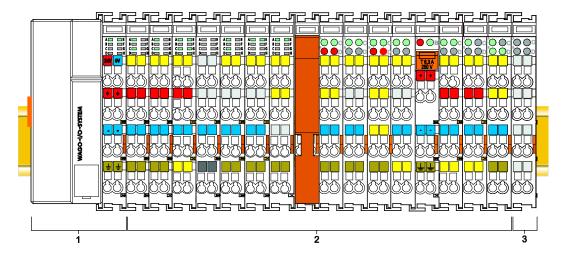

Figure 1: Fieldbus Node (Example)

Fieldbus couplers/controllers are available for different fieldbus systems.

The ECO coupler contains the fieldbus interface, electronics and a power supply for the system. The fieldbus interface forms the physical interface to the relevant fieldbus. The electronics process the data of the bus modules and make it available for the fieldbus communication.

I/O modules for diverse digital and analog I/O signals as well as special functions can be connected to the fieldbus coupler/controller. The communication between the fieldbus coupler/controller and the I/O modules is carried out via an internal bus.

The components of the WAGO-I/O-SYSTEM 750 have clear termination points, light emitting diodes for status display, plug-in mini WSB tags and group marker cards for labeling.

The 1, 2 or 3 wire technology supplemented by a ground wire connection allows for direct sensor or actuator wiring.

## 3.1 Manufacturing Number

The serial number indicates the delivery status directly after production. This number is part of the labeling on the side of each component.

In addition, the serial number is printed on the cover cap of the configuration and programming interface of the fieldbus coupler/controller, so that it can also be read when installed.

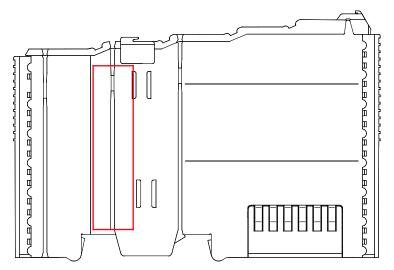

Figure 2: Marking Area for Serial Numbers

There are two serial numbers in two rows in the side marking. They are left of the release tab. The first 10 positions in the longer row of the serial numbers contain version and date identifications.

Example structure of the rows: 0114010101...

| 01                     | 14   | 01      | 01       | 01            | (additional positions) |
|------------------------|------|---------|----------|---------------|------------------------|
| $\mathbf{W}\mathbf{W}$ | YY   | FW      | HW       | $\mathbf{FL}$ | <b>-</b> ^             |
| Calendar               | Year |         | Hardware |               | Internal information   |
| week                   |      | version | version  | loader        |                        |
|                        |      |         |          | version       |                        |

The row order can vary depending on the production year, only the longer row is relevant. The back part of this and the shorter row contain internal administration information from the manufacturer.

## 3.2 Hardware Address (MAC ID)

Each ETHERNET Fieldbus Coupler has an internationally unambiguous physical address, referred to as the MAC-ID (Media Access Control Identity).

As part of the labeling on the right side of this component, the MAC ID is printed in the block diagram of the fieldbus coupler/controller.

In addition, the MAC ID is located on the paper strip with two self-adhesive peel-off strips on the left side of the fieldbus coupler/controller.

The MAC ID has a fixed length of 6 bytes (48 bits) which are presented hexadecimal. The first three bytes identify the manufacturer (e.g. 00:30 DE for WAGO). The second 3 bytes comprise the unique serial number of the hardware.

## 3.3 Component Update

For the case of an update of one component, the lateral marking on each component contains a prepared matrix.

This matrix makes columns available for altogether three updates to the entry of the current update data, like production order number (NO; starting from calendar week 13/2004), date stamp (DS), software version (SW), hardware version (HW) and the firmware loader version (FWL, if available).

| Current version data for |     | 1. Update | 2. Update | 3. Update |                       |
|--------------------------|-----|-----------|-----------|-----------|-----------------------|
| Production order no.     | NO  |           |           |           | ← only starting from  |
| Date stamp               | DS  |           |           |           | calendar week 13/2004 |
| Software version         | SW  |           |           |           |                       |
| Hardware version         | HW  |           |           |           |                       |
| Firmware loader vers.    | FWL |           |           |           | ← only for fieldbus   |
|                          |     |           |           |           | couplers/controllers  |

If the update of a component took place, the current version data are registered into the columns of the matrix.

Additionally with the update of a fieldbus coupler or controller also the cover of the configuration and programming interface of the fieldbus coupler or controller is imprinted with the current production order number.

The original manufacturing information on the device's housing remains unchanged.

## 3.4 Storage, Assembly and Transport

Whenever possible, the components are to be stored in their original packaging. Likewise, the original packaging provides optimal protection during transport.

When assembling or repacking the components, the contacts must not be soiled or damaged. The components must be stored and transported in appropriate containers/packaging. Thereby, the ESD information is to be regarded.

## 3.5 Assembly Guidelines/Standards

- DIN 60204 Electrical equipment of machines
- DIN EN 50178 Electronic equipment for use in power installations

(replacement for VDE 0160)

• EN 60439 Low-voltage switchgear and controlgear assemblies

## 3.6 Power Supply

#### 3.6.1 Isolation

Within the fieldbus node, there are three electrically isolated potentials:

- Electrically isolated fieldbus interface via transformer
- Electronics of the fieldbus couplers/controllers and the I/O modules (internal bus)
- All I/O modules have an electrical isolation between the electronics (internal bus, logic) and the field electronics. Some digital and analog input modules have each channel electrically isolated, please see catalog.

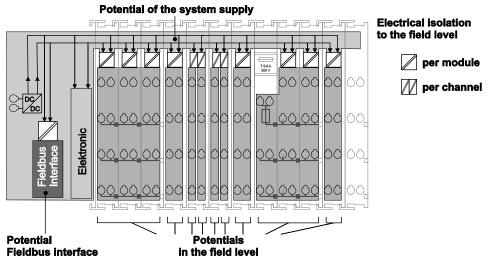

Figure 3: Isolation (example)

## 3.6.2 System Supply

#### 3.6.2.1 Connection

The WAGO-I/O-SYSTEM 750 requires a 24 V direct current system supply. The power supply is provided via the fieldbus coupler/controller and, if necessary, in addition via internal system supply modules 750-613. The power supply is reverse voltage protected.

## NOTICE

#### Do not use an incorrect voltage/frequency!

The use of an incorrect supply voltage or frequency can cause severe damage to the components.

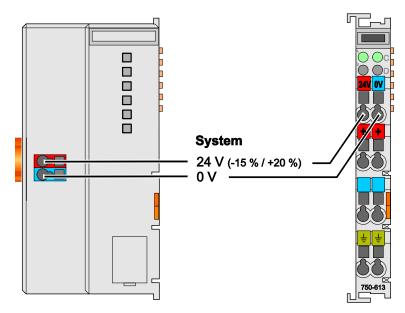

Figure 4: System supply

The fed DC 24 V supplies all internal system components, e.g. fieldbus coupler/controller electronics, fieldbus interface and I/O modules via the internal bus (5 V system voltage). The 5 V system voltage is galvanically connected to the 24 V system supply.

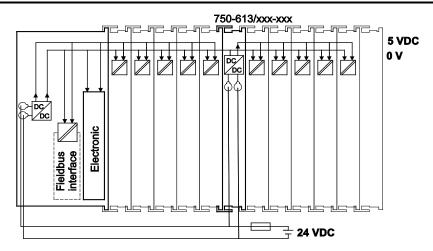

Figure 5: System voltage (example)

## Note

#### Only reset the system simultaneously for all supply modules!

Reset the system by switching the system supply simultaneously at all supply modules (fieldbus coupler/controller and potential supply module with bus power supply) off and on again.

#### 3.6.2.2 Dimensioning

## Note

#### Recommendation

A stable power supply cannot always be assumed. Therefore, you should use regulated power supplies to ensure the quality of the supply voltage.

The supply capacity of the fieldbus coupler/controller or the internal system supply module can be taken from the technical data of the components.

Table 4: Alignment

|                      | Current consumption via system voltage (5 V for electronics of I/O modules and fieldbus coupler/controller). |
|----------------------|--|
| <b>Total current</b> | Available current for the I/O modules. Provided by the bus   |
| for I/O modules*)    | power supply unit. See fieldbus coupler/controller and   |
|                      | internal system supply module  |

<sup>\*)</sup> See current catalog, manuals, Internet

#### **Example:**

#### Calculating the current consumption on an example coupler

| Sum I <sub>(5 V) total</sub>     | 1000 mA at 5V |
|----------------------------------|---------------|
| Residual current for bus modules | 700 mA at 5 V |
| Internal current consumption     | 300 mA at 5 V |

The internal current consumption is indicated in the technical data for each bus terminal. In order to determine the total requirement, add together the values of all I/O modules in the node.

## Note

# Please note the aggregate current for I/O modules. It may be necessary to supply potential!

When the sum of the internal current consumption for the I/O modules exceeds their aggregate current, you must use a supply module with bus power supply. Install it before the position where the permissible aggregate current would be exceeded.

#### **Example:**

#### Calculating the total current on the example coupler

A node with an example coupler consists e. g. of the following I/O modules: 20 relay modules (750-517) and 10 digital input modules (750-405).

| Sum                          |               | 940 mA |
|------------------------------|---------------|--------|
|                              | 20 * 2 mA =   | 40 mA  |
| Internal current consumption | 10 * 90  mA = | 900 mA |

In this example, the example coupler can provide 700 mA for the I/O modules. This value is given in the associated data sheet ("Total current for I/O modules"). Consequently, an internal system supply module (750-613), e. g. in the middle of the node, should be added.

## Note

#### Recommendation

Utilize the **smartDESIGNER** feature WAGO ProServe<sup>®</sup> software to configure fieldbus node assembly. You can test the configuration via the integrated plausibility check.

The maximum input current of the 24 V system supply is 500 mA. The exact electrical consumption  $(I_{(V)})$  can be determined with the following formulas:

#### Fieldbus coupler or controller

 $I_{(5\ V)\ total} = Sum\ of\ all\ the\ internal\ current\ consumption\ of\ the\ connected\ I/O\ modules\ +\ internal\ current\ consumption\ of\ the\ fieldbus\ coupler/controller$ 

#### Internal system supply module

 $I_{(5 \text{ V}) \text{ total}}$  = Sum of all the internal current consumption of the connected I/O modules at internal system supply module

Input current 
$$I_{(24\ V)} = \frac{5\ V}{24\ V} \times \frac{I_{(5\ V)\ total}}{\eta}$$

 $\eta$  = Efficiency of the power supply at nominal load 24 V

## Note

#### Activate all outputs when testing the current consumption!

If the electrical consumption of a power supply point for the 24 V system supply exceeds 500 mA, then the cause may be an improperly dimensioned node or a defect.

During the test, you must activate all outputs.

#### 3.6.3 Field Supply

#### 3.6.3.1 Connection

Sensors and actuators can be directly connected to the relevant channel of the I/O module in 1, 2, 3 or 4 conductor connection technology. The I/O module supplies power to the sensors and actuators. The input and output drivers of some I/O modules require the field side supply voltage.

The power supply modules provide field side power (DC 24V). In this case it is a passive power supply without protection equipment. Power supply modules are available for different potentials, e.g. DC 24 V, AC 230 V or others.

Power supply modules with or without fuse holder and diagnostic capability are available for the power supply of other field potentials (DC 24 V, AC/DC 0 ... 230 V, AC 120 V, AC 230 V). The power supply modules can also be used to set up various potential groups. The connections are connected in pairs to a power contact.

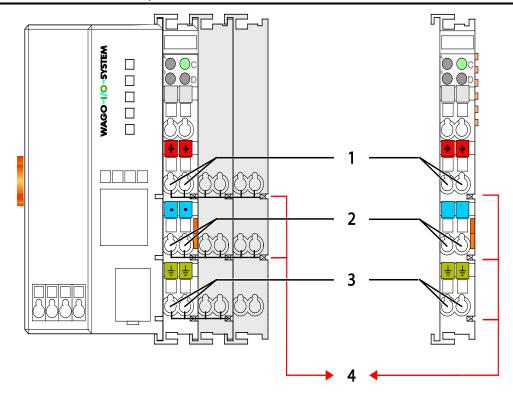

Figure 6: Field supply (sensor/actuator)

Table 5: Legend for Figure "Field Supply (Sensor/Actuator) for ECO Fieldbus Coupler"

| Field supply          |  |  |
|-----------------------|--|--|
| 1                     | 24 V (-15 % / +20 %)                           |  |
| 2                     | 0 V  |  |
| 3                     | Optional ground potential                      |  |
| Power jumper contacts |  |  |
| 4                     | Potential distribution to adjacent I/O modules |  |

## Note

# In exceptional instances, I/O modules can be directly connected to the field supply!

The 24 V field supply can be connected also directly to a bus module, if the connection points are not needed for the peripheral device supply. In this case, the connection points need the connection to the power jumper contacts.

The field-side power supply is automatically derived from the power jumper contacts when snapping an I/O module.

The current load of the power contacts must not exceed 10 A on a continual basis.

By inserting an additional power supply module, the field supply via the power contacts is disrupted. From there a new power supply occurs which may also contain a new voltage potential.

## Note

# Re-establish the ground connection when the connection to the power jumper contacts is disrupted!

Some I/O modules have no or very few power contacts (depending on the I/O function). Due to this, the passing through of the relevant potential is disrupted. If you require a field supply via power jumper contacts for subsequent I/O modules, then you have to use a power supply module.

Note the data sheets of the I/O modules.

## **Note**

Use a spacer module when setting up a node with different potentials! In the case of a node setup with different potentials, e.g. the alteration from DC 24 V to AC 230 V, you should use a spacer module. The optical separation of the notentials gots as a warning to head courting in the case of wiring and

the potentials acts as a warning to heed caution in the case of wiring and maintenance works. Thus, you can prevent the results of wiring errors.

#### 3.6.3.2 Fusing

Internal fusing of the field supply is possible for various field voltages via an appropriate power supply module.

Table 6: Power Supply Modules

| Order No.       | Field Voltage  |  |
|-----------------|--|--|
| 750-601         | 24 V DC, Supply/Fuse                                     |  |
| 750-609         | 230 V AC, Supply/Fuse                                    |  |
| 750-615         | 120 V AC, Supply/Fuse                                    |  |
| 750-617         | 24 V AC, Supply/Fuse                                     |  |
| 750-610         | 24 V DC, Supply/Fuse/Diagnosis                           |  |
| 750-611         | 230 V AC, Supply/Fuse/Diagnosis                          |  |
| 750-606         | Supply Module 24 V DC, 1,0 A, Ex i                       |  |
| 750-625/000-001 | Supply Module 24 V DC, 1,0 A, Ex i (without diagnostics) |  |

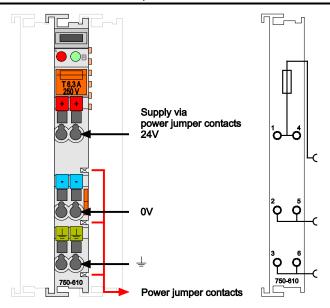

Figure 7: Supply Module with Fuse Carrier (Example 750-610)

### NOTICE

**Observe the maximum power dissipation and, if required, UL requirements!** In the case of power supply modules with fuse holders, you must only use fuses with a maximum dissipation of 1.6 W (IEC 127).

For UL approved systems only use UL approved fuses.

In order to insert or change a fuse, or to switch off the voltage in succeeding I/O modules, the fuse holder may be pulled out. In order to do this, use a screwdriver for example, to reach into one of the slits (one on both sides) and pull out the holder.

Figure 8: Removing the Fuse Carrier

Lifting the cover to the side opens the fuse carrier.

Figure 9: Opening the Fuse Carrier

Figure 10: Changing the Fuse

After changing the fuse, the fuse carrier is pushed back into its original position.

Alternatively, fusing can be done externally. The fuse modules of the WAGO series 281 and 282 are suitable for this purpose.

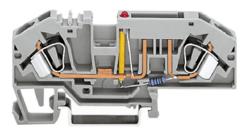

Figure 11: Fuse Modules for Automotive Fuses, Series 282

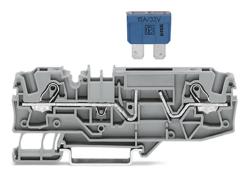

Figure 12: Fuse Modules for Automotive Fuses, Series 2006

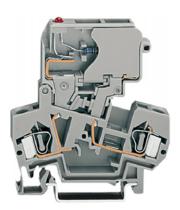

Figure 13: Fuse Modules with Pivotable Fuse Carrier, Series 281

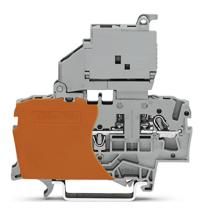

Figure 14: Fuse Modules with Pivotable Fuse Carrier, Series 2002

#### 3.6.4 Supplementary Power Supply Regulations

The WAGO-I/O-SYSTEM 750 can also be used in shipbuilding or offshore and onshore areas of work (e. g. working platforms, loading plants). This is demonstrated by complying with the standards of influential classification companies such as Germanischer Lloyd and Lloyds Register.

Filter modules for 24 V supply are required for the certified operation of the system.

| Order No. | Name          | Description  |
|-----------|---------------|--|
| 750-626   | Supply Filter | Filter module for system supply and field supply       |
|           |               | (24 V, 0 V), i. e. for fieldbus coupler/controller and |
|           |               | bus power supply (750-613)                             |
| 750-624   | Supply Filter | Filter module for the 24 V field supply                |
|           |               | (750-602, 750-601, 750-610)                            |

Therefore, the following power supply concept must be absolutely complied with.

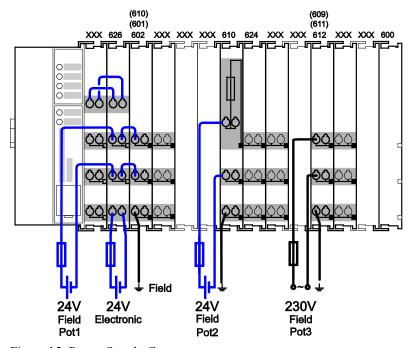

Figure 15: Power Supply Concept

## Note

#### Use a supply module for equipotential bonding!

Use an additional 750-601/602/610 Supply Module behind the 750-626 Filter Module if you want to use the lower power jumper contact for equipotential bonding, e.g., between shielded connections and require an additional tap for this potential.

### 3.6.5 Supply Example

# Note

### The system supply and the field supply shall be separated!

You should separate the system supply and the field supply in order to ensure bus operation in the event of a short-circuit on the actuator side.

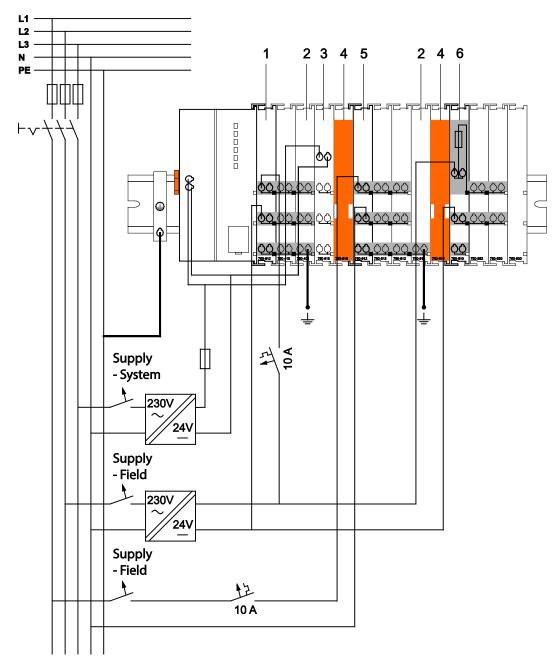

Figure 16: Supply example

Table 8: Legend for Figure "Supply Example for Fieldbus Coupler/Controller"

| Pos. | Description  |  |
|------|--|--|
| 1    | Power Supply on fieldbus coupler/controller via external Supply Module |  |
| 2    | Power Supply with optional ground                                      |  |
| 3    | Internal System Supply Module  |  |
| 4    | Separation module recommended  |  |
| 5    | Supply Module passive  |  |
| 6    | Supply Module with fuse carrier/diagnostics                            |  |

### 3.6.6 Power Supply Unit

The WAGO-I/O-SYSTEM 750 requires a 24 VDC voltage (system supply).

## Note

#### Recommendation

A stable power supply cannot always be assumed everywhere. Therefore, you should use regulated power supplies to ensure the quality of the supply voltage.

For brief voltage dips, a buffer (200 µF per 1 A load current) must be provided.

### Note

#### **Buffer for system power supply!**

The system power supply must be buffered to bridge power outages. As the power demand depends on the respective node configuration, buffering is not implemented internally.

To achieve power outages of 1 ms to 10 ms according to IEC61131-2, determine the buffering appropriate for your node configuration and structure it as an external circuit.

The power demand must be determined individually depending on the entry point of the field supply. All loads through field devices and I/O modules must be taken into account. The field supply also impacts the I/O modules because the input and output drivers of some I/O modules require the voltage of the field supply.

### Note

#### System and field supply must be isolated!

The system supply and field supply must be isolated to ensure bus operation in the event of short circuits on the actuator side.

# Information

#### Power supply units are available in the eShop.

You can find suitable power supply units, e. g. from the EPSITRON series, in the eShop on <a href="https://www.wago.com">www.wago.com</a>.

### 3.7 Grounding

#### 3.7.1 Grounding the DIN Rail

#### 3.7.1.1 Framework Assembly

When setting up the framework, the carrier rail must be screwed together with the electrically conducting cabinet or housing frame. The framework or the housing must be grounded. The electrical connection is established via the screw. Thus, the carrier rail is grounded.

### **▲** DANGER

#### Ensure sufficient grounding is provided!

You must take care to ensure the flawless electrical connection between the carrier rail and the frame or housing in order to guarantee sufficient grounding.

#### 3.7.1.2 Insulated Assembly

Insulated assembly has been achieved when there is constructively no direct ohmic contact between the cabinet frame or machine parts and the carrier rail. Here, the earth ground must be set up via an electrical conductor in accordance with valid national safety regulations.

# Note

#### Recommendation

The optimal setup is a metallic assembly plate with grounding connection which is electrically conductive linked to the carrier rail.

The separate grounding of the carrier rail can be easily set up with the aid of the WAGO ground wire terminals.

Table 9: WAGO Ground Wire Terminals

| Order No. | Description  |  |
|-----------|--|--|
| 283-609   | 1-conductor ground (earth) terminal block make an automatic contact                  |  |
|           | to the carrier rail; conductor cross section: 0.2 mm <sup>2</sup> 16 mm <sup>2</sup> |  |
|           | <b>Note</b> : Also order the end and intermediate plate (283-320).                   |  |

### 3.7.2 Grounding Function

The grounding function increases the resistance against electro-magnetic interferences. Some components in the I/O system have a carrier rail contact that dissipates electro-magnetic interferences to the carrier rail.

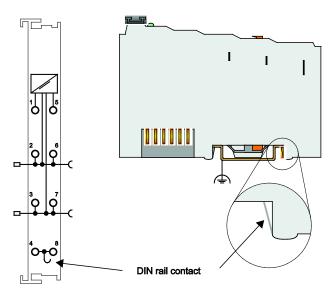

Figure 17: Carrier Rail Contact (Example)

### DANGER

#### Ensure sufficient grounding is provided!

You must take care to ensure the direct electrical connection between the carrier rail contact and the carrier rail.

The carrier rail must be grounded.

For information on carrier rail properties, see section "Mounting" > ... > "Carrier Rail Properties".

The bottom CAGE CLAMP® connectors of the supply modules enable optional connection of a field-side functional ground. This potential is made available to the I/O module arranged on the right through the spring-loaded contact of the three power contacts. Some I/O modules are equipped with a knife-edge contact that taps this potential. This forms a potential group with regard to functional ground with the I/O module arranged on the left.

### 3.8 Shielding

#### 3.8.1 General

Use of shielded cables reduces electromagnetic interference and thus increases signal quality. Measurement errors, data transmission errors and interference due to excessive voltage can be prevented.

### Note

#### Connect the cable shield to the ground potential!

Integrated shielding is mandatory to meet the technical specifications in regards to measuring accuracy. Connect the cable shield and ground potential at the inlet to the cabinet or housing. This allows induced interference to dissipate and to be kept away from devices in the cabinet or housing.

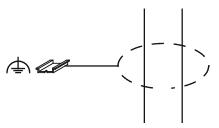

Figure 18: Cable Shield at Ground Potential

## Note

Improve shielding performance by placing the shield over a large area!

Higher shielding performance is achieved via low-impedance connection between shield and ground. For this purpose, connect the shield over a large surface area, e.g., WAGO shield connecting system. This is especially recommended for large-scale systems where equalizing current or high impulse-type currents caused by atmospheric discharge may occur.

## Note

#### Keep data and signal lines away from sources of interference!

Route data and signal lines separately from all high voltage cables and other sources of high electromagnetic emission (e.g., frequency converter or drives).

#### 3.8.2 Bus Cables

The shielding of the bus line is described in the respective configuration guidelines and standards of the bus system.

### 3.8.3 Signal Lines

I/O modules for analog signals and some interface I/O modules are equipped with shield clamps.

# Note

#### Use shielded signal lines!

Only use shielded signal lines for analog signals and I/O modules which are equipped with shield clamps. Only then can you ensure that the accuracy and interference immunity specified for the respective I/O module can be achieved even in the presence of interference acting on the signal cable.

### 3.8.4 WAGO Shield Connecting System

The WAGO shield connecting system consists of shield clamping saddles, busbars and various mounting carriers. These components can be used to achieve many different configurations.

Figure 19: Examples of the WAGO Shield Connecting System

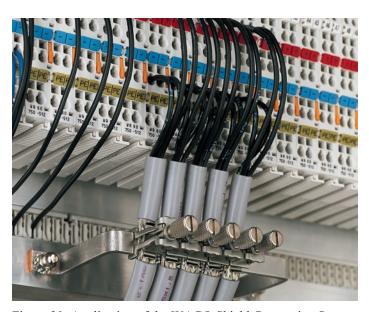

Figure 20: Application of the WAGO Shield Connecting System

## 4 Device Description

The 750-352 Fieldbus Coupler connects the WAGO-I/O-SYSTEM 750 or 753 to the ETHERNET fieldbus system.

This coupler can be used for applications in machine and plant construction as well as in the process industry and building technology.

Equipped with two RJ-45 ports, which both work as 2-channel switches, the Fieldbus coupler enables easy and cost-effective cabling such as linear bus topology for which no additional external switches or hubs are required.

With the DIP switch the last byte of the IP address, as well as the assignment of the IP address (DHCP, BootP, firm setting) can be given.

In the Fieldbus Coupler, all input signals from the sensors are combined. After connecting the Fieldbus Coupler, the Fieldbus Coupler determines which I/O modules are on the node and creates a local process image from these. Analog and specialty module data is sent via words and/or bytes; digital data is grouped bit-by-bit.

The local process image is divided into two data zones containing the data received and the data to be sent.

The data of the analog modules is mapped first into the process image. The modules are mapped in the order of their physical position after the Coupler.

The bits of the digital modules are combined into words and then mapped after the analog ones in the process image. If the number of digital I/Os is greater than 16 bits, the Fieldbus Coupler automatically begins a new word.

All sensor input signals are grouped in the coupler (slave) and transferred to the higher-order controller (master) via the fieldbus. Process data linking is performed in the higher-order controller. The higher-order controller puts out the resulting data to the actuators via the bus and the node.

The fieldbus connection consists of two ports (RJ-45). An ETHERNET switch integrated in the fieldbus coupler operates in the store and forward mode. Both ports support:

- 10BASE-T / 100BASE-TX
- Full / Half duplex
- Autonegotiation
- Auto-MDI(X)

In order to send process data via ETHERNET, the Coupler supports a series of network protocols.

The MODBUS/TCP(UDP) protocol and the ETHERNET/IP protocol are implemented for exchanging process data.

The two communication protocols can be used optional or together.

For the management and diagnosis of the system, the HTTP and SNMP protocols are available.

For the data transfer via ETHERNET the FTP is available.

For the automatic assignment of the IP address in the network, kann alternatively DHCP or BootP can be used.

An internal server is available for Web-based applications.

HTML pages stored in the Fieldbus Coupler allow access to information about the configuration, the status and the I/O data of the fieldbus node via Web browsers. It is also possible to store individual HTML pages using the implemented file system, store custom HTML pages.

### 4.1 View

The view below shows the different parts of the device:

- The fieldbus connection is within the lower range on the left side.
- Over the fieldbus connection is a power supply unit for the system supply.
- LEDs for bus communication, error messages and diagnostics are within the upper range on the right side.
- Down right the service interface is to be found.

### 4.2 Connectors

## 4.2.1 Device Supply

The device is powered via terminal blocks with CAGE CLAMP® connections.

The device supply generates the necessary voltage to power the electronics of the device and the internal electronics of the connected I/O modules.

The fieldbus interface is galvanically separated to the electrical potential of the device.

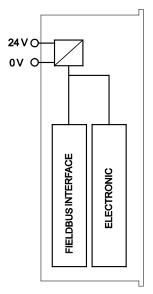

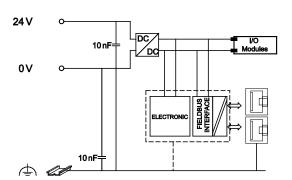

Figure 22: Device Supply

#### 4.2.2 Fieldbus Connection

The connection to the fieldbus is made via two RJ-45 plugs, which are connected to the fieldbus controller via an integrated switch.

The integrated switch works in store-and-forward operation and for each port, supports the transmission speeds 10/100 Mbit as well as the transmission modes full and half-duplex and autonegotiation.

The wiring of these plugs corresponds to the specifications for 100BaseTX, which prescribes a category 5 twisted pair cable as the connecting cable. Cable types S-UTP (Screened Unshielded Twisted Pair) and STP (Shielded Twisted Pair) with a maximum segment length of 100 m (approximately 328.08 feet) can be used.

The RJ-45 socket is arranged physically lower, allowing the coupler to fit in an 80 mm high enclosure once connected.

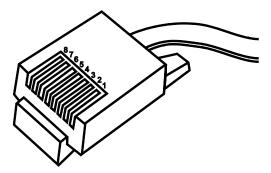

Figure 23: RJ-45 Connector

Table 11: RJ-45 Connector and RJ-45 Connector Configuration

| Contact | Signal | Signal     |  |
|---------|--------|------------|--|
| 1       | TD+    | Transmit + |  |
| 2       | TD -   | Transmit - |  |
| 3       | RD+    | Receive +  |  |
| 4       |        | free       |  |
| 5       |        | free       |  |
| 6       | RD -   | Receive -  |  |
| 7       |        | free       |  |
| 8       |        | free       |  |

### NOTICE

#### Do not use in telecommunication circuits!

Only use devices equipped with ETHERNET or RJ-45 connectors in LANs. Never connect these devices with telecommunication networks.

## 4.3 Display Elements

The operating condition of the fieldbus coupler or the node is displayed with the help of illuminated indicators in the form of light-emitting diodes (LEDs). The LED information is routed to the top of the case by light guides. In some cases, the LEDs are multi-colored (red, green or orange).

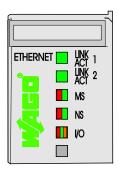

Figure 24: Display Elements

For the diagnostics of the different ranges fieldbus and node, the LED's can be divided into groups:

Table 12: Display Elements Fieldbus Status

| LED           | Color     | Meaning  |
|---------------|-----------|--|
| LINK<br>ACT 1 | green     | indicates a connection to the physical network at port 1 |
| LINK<br>ACT 2 | green     | indicates a connection to the physical network at port 2 |
| MS            | red/green | indicates the status of the node                         |
| NS            | red/green | indicates the network status                             |

Table 13: Display Elements Node Status

| LED | Color      | Meaning   |
|-----|------------|---|
| I/O | red/green/ | Indicates the operation of the node and signals via a blink code faults |
|     | orange     | encountered.  |

# Information

#### More information about the LED Signaling

Read the detailed description for the evaluation of the displayed LED state in the section "Diagnostics" > ... > "LED Signaling".

### 4.4 Operating Elements

#### 4.4.1 Service Interface

The service interface is located behind the flap.

It is used for the communication with the WAGO-I/O-*CHECK* and for downloading the firmware updates.

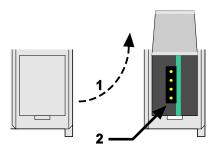

Figure 25: Service Interface (Closed and Opened Flap)

Table 14: Legend for Figure "Service Interface (Closed and Opened Flap)"

| Number | Description            |  |
|--------|------------------------|--|
| 1      | Open closed            |  |
| 2      | View Service Interface |  |

### NOTICE

#### Device must be de-energized!

To prevent damage to the device, unplug and plug in the communication cable only when the device is de-energized!

The connection to the 4-pin header under the cover flap can be realized via the communication cables with the item numbers 750-920 and 750-923 or via the WAGO radio adapter with the item number 750-921.

#### 4.4.2 Address Selection Switch

Figure 26: Address Selection Switch (for example setting "0")

The configuration of the IP address via the address selection switch takes place when you set the host ID (last digit of the IP address).

The coding of the host ID is bit by bit and begins with address selection switch 1 for bit 0 (LSB) and ends with address selection switch 8 for bit 7 (MSB).

The base address used depends on the IP address currently saved in the coupler. With the original factory settings, the IP address is configured to the value 0.0.0.0. by default. In this case, the static base address 192.168.1.X is used.

### 4.5 Technical Data

### 4.5.1 Device Data

### 4.5.3 Safe electrical Isolation

Table 2: Technical Data – Safe electrical Isolation

| Air and creepage distance | Acc. to IEC 60664-1 |
|---------------------------|---------------------|
| Degree of pollution       | 2                   |
| acc. to IEC 61131-2       |                     |

# 4.5.4 Degree of Protection

Table 3: Technical Data - Degree of Protection

| Degree of protection | IP 20 |
|----------------------|-------|

### **4.5.5** Supply

Table 4: Technical Data - Supply

| Voltage Supply                       | DC 24 V (-25% +30%)             |
|--------------------------------------|---------------------------------|
| Input current <sub>max.</sub> (24 V) | 280 mA                          |
| Power failure time acc. IEC 61131-2  | Depending on external buffering |
| Efficiency of the power supply       | 90 %                            |
| Internal current consumption (5 V)   | 450 mA                          |
| Total current for I/O modules (5 V)  | 700 mA                          |
| Isolation                            | 500 V system/supply             |

# Note

#### **Buffer for system power supply!**

The system power supply must be buffered to bridge power outages. As the power demand depends on the respective node configuration, buffering is not implemented internally.

To achieve power outages of 1 ms to 10 ms according to IEC61131-2, determine the buffering appropriate for your node configuration and structure it as an external circuit.

|                            | b) Period of oscillation:   |
|                            | 10 sweep per axis in each of the 3 vertical axes                  |
| Shock resistance           | acc. to IEC 60068-2-27  |
|                            | Comment to the shock resistance:                                  |
|                            | a) Type of impulse: half sinusoidal                               |
|                            | b) Intensity of impulse:  |
|                            | 15 g peak value, 11 ms maintenance time                           |
|                            | c) Route of impulse:  |
|                            | 3 impulses in each pos. And neg. direction of the 3               |
|                            | vertical axes of the test object, this means 18 impulses          |
|                            | in all.   |
| Free fall                  | acc. IEC 60068-2-32   |
|                            | ≤ 1 m (module in original packing)                                |

### 4.6 Approvals

# Information

#### More information about approvals.

Detailed references to the approvals are listed in the document "Overview Approvals **WAGO-I/O-SYSTEM 750**", which you can find via the internet under: <a href="www.wago.com">www.wago.com</a> > SERVICES > DOWNLOADS > Additional documentation and information on automation products > WAGO-I/O-SYSTEM 750 > System Description.

The following approvals have been granted to 750-352 fieldbus coupler/controller:

 $_{\rm C}UL_{\rm US}$ 

**UL508** 

(6

**Conformity Marking** 

The following approvals have been granted to the basic version of the fieldbus coupler/controller "ETHERNET Fieldbus Coupler" (750-352):

Korea Certification

MSIP-REM-W43-FBC750

The following Ex approvals have been granted to 750-352 fieldbus coupler/controller:

TÜV 07 ATEX 554086 X

I M2 Ex d I Mb II 3 G Ex nA IIC T4 Gc II 3 D Ex tc IIIC T135°C Dc

IECEx TUN 09.0001 X

Ex d I Mb Ex nA IIC T4 Gc Ex tc IIIC T135°C Dc

 $_{\rm C}UL_{\rm US}$ 

ANSI/ISA 12.12.01

Class I, Div2 ABCD T4

The following ship approvals have been granted to the basic version of 750-352 fieldbus coupler/controller:

ABS (American Bureau of Shipping)

Federal Maritime and Hydrographic Agency

BV (Bureau Veritas)

DNV (Det Norske Veritas) Class B

GL (Germanischer Lloyd)

Cat. A, B, C, D (EMC 1)

KR (Korean Register of Shipping)

LR (Lloyd's Register)

Env. 1, 2, 3, 4

NKK (Nippon Kaiji Kyokai)

PRS (Polski Rejestr Statków)

RINA (Registro Italiano Navale)

# Information

For more information about the ship approvals:

Note the "Supplementary Power Supply Regulations" section for the ship approvals.

### 4.7 Standards and Guidelines

750-352 meets the following requirements on emission and immunity of interference:

EMC CE-Immunity to interference EN 61000-6-2

EMC CE-Emission of interference acc. to EN 61000-6-3

EMC marine applications-Immunity

to interference acc. to DNV GL

EMC marine applications-Emission

of interference acc. to DNV GL

# 5 Mounting

#### 5.1 Installation Position

Along with horizontal and vertical installation, all other installation positions are allowed.

## Note

#### Use an end stop in the case of vertical mounting!

In the case of vertical assembly, an end stop has to be mounted as an additional safeguard against slipping.

WAGO order no. 249-116 End stop for DIN 35 rail, 6 mm wide WAGO order no. 249-117 End stop for DIN 35 rail, 10 mm wide

### 5.2 Overall Configuration

The maximum total length of a fieldbus node without fieldbus coupler/controller is 780 mm including end module. The width of the end module is 12 mm. When assembled, the I/O modules have a maximum length of 768 mm.

#### **Examples:**

- 64 I/O modules with a 12 mm width can be connected to a fieldbus coupler/controller.
- 32 I/O modules with a 24 mm width can be connected to a fieldbus coupler/controller.

#### **Exception:**

The number of connected I/O modules also depends on the type of fieldbus coupler/controller is used. For example, the maximum number of stackable I/O modules on one PROFIBUS DP/V1 fieldbus coupler/controller is 63 with no passive I/O modules and end module.

# NOTICE

#### Observe maximum total length of a fieldbus node!

The maximum total length of a fieldbus node without fieldbus coupler/controller and without using a 750-628 I/O Module (coupler module for internal data bus extension) may not exceed 780 mm.

Also note the limitations of individual fieldbus couplers/controllers.

# Note

# Increase the total length using a coupler module for internal data bus extension!

You can increase the total length of a fieldbus node by using a 750-628 I/O Module (coupler module for internal data bus extension). For such a configuration, attach a 750-627 I/O Module (end module for internal data bus extension) after the last I/O module of a module assembly. Use an RJ-45 patch cable to connect the I/O module to the coupler module for internal data bus extension of another module block.

This allows you to segment a fieldbus node into a maximum of 11 blocks with maximum of 10 I/O modules for internal data bus extension.

The maximum cable length between two blocks is five meters.

More information is available in the manuals for the 750-627 and 750-628 I/O Modules.

### 5.3 Mounting onto Carrier Rail

### 5.3.1 Carrier Rail Properties

All system components can be snapped directly onto a carrier rail in accordance with the European standard EN 50022 (DIN 35).

### NOTICE

**Do not use any third-party carrier rails without approval by WAGO!** WAGO Kontakttechnik GmbH & Co. KG supplies standardized carrier rails that are optimal for use with the I/O system. If other carrier rails are used, then a technical inspection and approval of the rail by WAGO Kontakttechnik GmbH & Co. KG should take place.

Carrier rails have different mechanical and electrical properties. For the optimal system setup on a carrier rail, certain guidelines must be observed:

- The material must be non-corrosive.
- Most components have a contact to the carrier rail to ground electromagnetic disturbances. In order to avoid corrosion, this tin-plated carrier rail contact must not form a galvanic cell with the material of the carrier rail which generates a differential voltage above 0.5 V (saline solution of 0.3 % at 20°C).
- The carrier rail must optimally support the EMC measures integrated into the system and the shielding of the I/O module connections.
- A sufficiently stable carrier rail should be selected and, if necessary, several mounting points (every 20 cm) should be used in order to prevent bending and twisting (torsion).
- The geometry of the carrier rail must not be altered in order to secure the safe hold of the components. In particular, when shortening or mounting the carrier rail, it must not be crushed or bent.
- The base of the I/O components extends into the profile of the carrier rail. For carrier rails with a height of 7.5 mm, mounting points are to be riveted under the node in the carrier rail (slotted head captive screws or blind rivets).
- The medal springs on the bottom of the housing must have low-impedance contact with the DIN rail (wide contact surface is possible).

#### 5.3.2 WAGO DIN Rail

WAGO carrier rails meet the electrical and mechanical requirements shown in the table below.

Table 23: WAGO DIN Rail

| Order number  | Description  |
|---------------|--|
| 210-113 /-112 | $35 \times 7.5$ ; 1 mm; steel yellow chromated; slotted/unslotted  |
| 210-114 /-197 | $35 \times 15$ ; 1.5 mm; steel yellow chromated; slotted/unslotted |
| 210-118       | $35 \times 15$ ; 2.3 mm; steel yellow chromated; unslotted         |
| 210-198       | $35 \times 15$ ; 2.3 mm; copper; unslotted                         |
| 210-196       | 35 × 8.2; 1.6 mm; aluminum; unslotted                              |

# 5.4 Spacing

The spacing between adjacent components, cable conduits, casing and frame sides must be maintained for the complete fieldbus node.

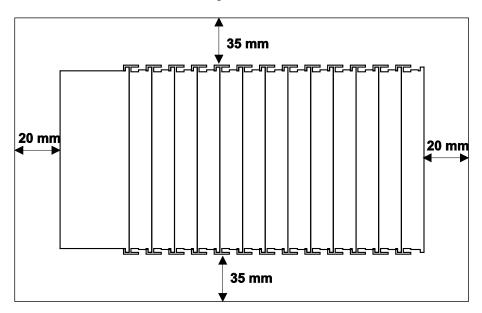

Figure 27: Spacing

The spacing creates room for heat transfer, installation or wiring. The spacing to cable conduits also prevents conducted electromagnetic interferences from influencing the operation.

### 5.5 Mounting Sequence

Fieldbus couplers/controllers and I/O modules of the WAGO-I/O-SYSTEM 750/753 are snapped directly on a carrier rail in accordance with the European standard EN 50022 (DIN 35).

The reliable positioning and connection is made using a tongue and groove system. Due to the automatic locking, the individual devices are securely seated on the rail after installation.

Starting with the fieldbus coupler/controller, the I/O modules are mounted adjacent to each other according to the project design. Errors in the design of the node in terms of the potential groups (connection via the power contacts) are recognized, as the I/O modules with power contacts (blade contacts) cannot be linked to I/O modules with fewer power contacts.

# **△ CAUTION**

#### Risk of injury due to sharp-edged blade contacts!

The blade contacts are sharp-edged. Handle the I/O module carefully to prevent injury.

# **NOTICE**

#### Insert I/O modules only from the proper direction!

All I/O modules feature grooves for power jumper contacts on the right side. For some I/O modules, the grooves are closed on the top. Therefore, I/O modules featuring a power jumper contact on the left side cannot be snapped from the top. This mechanical coding helps to avoid configuration errors, which may destroy the I/O modules. Therefore, insert I/O modules only from the right and from the top.

### Note

#### Don't forget the bus end module!

Always plug a bus end module 750-600 onto the end of the fieldbus node! You must always use a bus end module at all fieldbus nodes with WAGO-I/O-SYSTEM 750 fieldbus couplers/controllers to guarantee proper data transfer.

# 5.6 Inserting and Removing Devices

### NOTICE

Perform work on devices only if they are de-energized!

Working on energized devices can damage them. Therefore, turn off the power supply before working on the devices.

### 5.6.1 Inserting the Fieldbus Coupler/Controller

- 1. When replacing the fieldbus coupler/controller for an already available fieldbus coupler/controller, position the new fieldbus coupler/controller so that the tongue and groove joints to the subsequent I/O module are engaged.
- 2. Snap the fieldbus coupler/controller onto the carrier rail.
- 3. Use a screwdriver blade to turn the locking disc until the nose of the locking disc engages behind the carrier rail (see the following figure). This prevents the fieldbus coupler/controller from canting on the carrier rail.

With the fieldbus coupler/controller snapped in place, the electrical connections for the data contacts and power contacts (if any) to the possible subsequent I/O module are established.

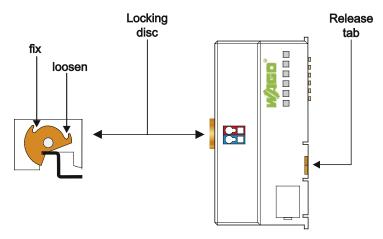

Figure 28: Release Tab

### 5.6.2 Removing the Fieldbus Coupler/Controller

- 1. Use a screwdriver blade to turn the locking disc until the nose of the locking disc no longer engages behind the carrier rail.
- 2. Remove the fieldbus coupler/controller from the assembly by pulling the release tab.

Electrical connections for data or power contacts to adjacent I/O modules are disconnected when removing the fieldbus coupler/controller.

### 5.6.3 Inserting the I/O Module

1. Position the I/O module so that the tongue and groove joints to the fieldbus coupler/controller or to the previous or possibly subsequent I/O module are engaged.

Figure 29: Insert I/O Module (Example)

2. Press the I/O module into the assembly until the I/O module snaps into the carrier rail.

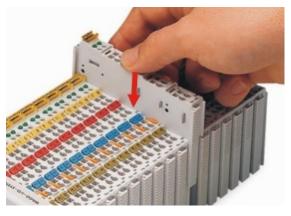

Figure 30: Snap the I/O Module into Place (Example)

With the I/O module snapped in place, the electrical connections for the data contacts and power jumper contacts (if any) to the fieldbus coupler/controller or to the previous or possibly subsequent I/O module are established.

### 5.6.4 Removing the I/O Module

1. Remove the I/O module from the assembly by pulling the release tab.

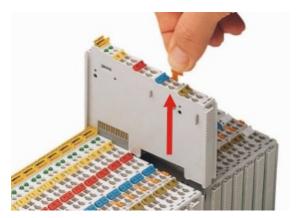

Figure 31: Removing the I/O Module (Example)

Electrical connections for data or power jumper contacts are disconnected when removing the I/O module.

### 6 Connect Devices

#### 6.1 Data Contacts/Internal Bus

Communication between the fieldbus coupler/controller and the I/O modules as well as the system supply of the I/O modules is carried out via the internal bus. It is comprised of 6 data contacts, which are available as self-cleaning gold spring contacts.

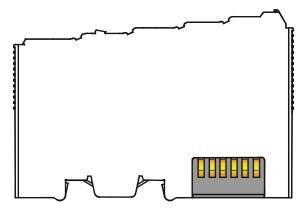

Figure 32: Data Contacts

### NOTICE

Do not place the I/O modules on the gold spring contacts!

Do not place the I/O modules on the gold spring contacts in order to avoid soiling or scratching!

### NOTICE

### Ensure that the environment is well grounded!

The devices are equipped with electronic components that may be destroyed by electrostatic discharge. When handling the devices, ensure that the environment (persons, workplace and packing) is well grounded. Avoid touching conductive components, e.g. data contacts.

### 6.2 Power Contacts/Field Supply

# **△ CAUTION**

#### Risk of injury due to sharp-edged blade contacts!

The blade contacts are sharp-edged. Handle the I/O module carefully to prevent injury.

Self-cleaning power jumper contacts used to supply the field side are located on the right side of most of the fieldbus couplers/controllers and on some of the I/O modules. These contacts come as touch-proof spring contacts. As fitting counterparts the I/O modules have male contacts on the left side.

#### Power jumper contacts

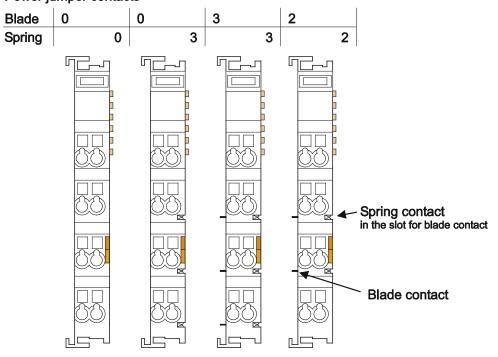

Figure 33: Example for the Arrangement of Power Contacts

### Note

### Field bus node configuration and test via smartDESIGNER

With the WAGO ProServe<sup>®</sup> Software smartDESIGNER, you can configure the structure of a fieldbus node. You can test the configuration via the integrated accuracy check.

# 6.3 Connecting a Conductor to the CAGE CLAMP®

The WAGO CAGE CLAMP® connection is appropriate for solid, stranded and finely stranded conductors.

### Note

Only connect one conductor to each CAGE CLAMP<sup>®</sup>!
Only one conductor may be connected to each CAGE CLAMP<sup>®</sup>.
Do not connect more than one conductor at one single connection!

If more than one conductor must be routed to one connection, these must be connected in an up-circuit wiring assembly, for example using WAGO feed-through terminals.

- 1. For opening the CAGE CLAMP® insert the actuating tool into the opening above the connection.
- 2. Insert the conductor into the corresponding connection opening.
- 3. For closing the CAGE CLAMP® simply remove the tool. The conductor is now clamped firmly in place.

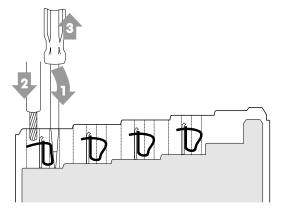

Figure 34: Connecting a Conductor to a CAGE CLAMP®

# 7 Function Description

### 7.1 Operating System

After master configuration and electrical installation of the fieldbus station, the system is operative.

The coupler begins running up after switching on the power supply or after a reset.

Upon initialization, the fieldbus coupler determines the I/O modules and configuration. The 'I/O' LED flashes red. After a trouble-free start-up, the coupler enters "Fieldbus start" mode and the 'I/O' LED lights up green. In the event of a failure, the 'I/O' LED will blink continuously. Detailed error messages are indicated by blinking codes; an error is indicated cyclically by up to 3 blinking sequences.

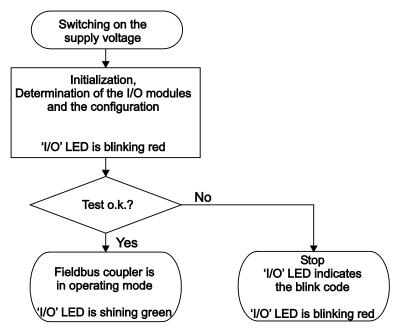

Figure 35: Operating System

# Information

#### More information about the LED Signaling

Read the detailed description for the evaluation of the displayed LED state in the section "Diagnostics" > ... > "LED Signaling".

#### 7.2 Process Data Architecture

After switching on the supply voltage, the fieldbus coupler identifies all I/O modules connected with the node that send or receive data (data width/bit width > 0). In the maximum total extension the node can consist of a mixed arrangement of a maximum of 64 analog and digital I/O modules, connected on the fieldbus coupler.

The data of the digital I/O modules are bit-oriented; i.e., digital data are sent bit by bit. The data of the analog I/O modules are byte-oriented; i.e., analog data are sent byte by byte. The term "Analog I/O modules" represents the group of byte-oriented I/O modules, which send data byte by byte. This group includes, e.g. counter modules, I/O modules for angle and distance measurement, and communication modules.

| Data width = 1 bit per Channel                 | Data width ≥ 1 word per Channel        |
|--|--|
| Digital input modules                          | Analog input modules                   |
| Digital output modules                         | Analog output modules                  |
| Digital output modules with diagnostics        | Analog input modules for Thermocouples |
| Power supply modules with diagnostics          | Analog input modules for RTDs          |
| Solid State Relay                              | Pulse width output modules             |
| Relay output modules                           | Interface modules                      |
| Up/Down counter                                |  |
| I/O modules for angle and distance measurement |  |

The fieldbus coupler stores the process data in the process images. The fieldbus coupler works with a process output data image (PIO) and a process input data image (PII).

The PIO is filled of the fieldbus master with the process output data. The PII is filled of the fieldbus coupler with the process input data.

Into the input and output process image the data of the I/O modules are stored in the sequence of its position after the fieldbus coupler in the individual process image.

First, all the byte-oriented I/O modules are stored in the process image, then the bit-oriented I/O modules. The bits of the digital I/O modules are grouped into bytes. If the amount of digital I/O information exceeds 8 bits, the fieldbus coupler automatically starts a new byte.

# NOTICE

#### Avoid equipment damages due to addressing errors!

To avoid equipment damages within the field range, you must consider that, depending on the specific position of an I/O module in the fieldbus node, the process data of all previous byte or bit-oriented modules must be taken into account to determine its location in the process data map.

## Note

#### Consider the Process Data size for each module!

Observe the number of input and output bits or bytes for the individual I/O modules.

## Note

### **Expandable with Module Bus Extension Coupler and End Module!**

With the use of the WAGO Module Bus Extension Coupler Module 750-628 and the End Module 750-627, it is possible to operate up to 250 modules on the device.

For some I/O modules and their different versions, the structure of the process data depends on the fieldbus.

# Information

#### Additional information about the fieldbus specific process image

For the fieldbus-specific process image of any WAGO-I/O-Module, please refer to the section "Structure of the Process Data".

## 7.3 Data Exchange

With the fieldbus coupler, data is exchanged either via the MODBUS/TCP protocol or via Ethernet/IP.

MODBUS/TCP works according to the master/slave principle. The master controller can be a PC or a PLC.

The fieldbus couplers of the WAGO-I/O-SYSTEM 750 are slave devices.

The master requests communication. This request can be directed to certain nodes by addressing. The nodes receive the request and, depending on the request type, send a reply to the master.

A coupler can set up a defined number of simultaneous connections (socket connections) to other network subscribers:

- 3 connections for HTTP (to read HTML pages from the coupler)
- 15 connections via MODBUS/TCP (to read or write input and output data of the coupler)
- 128 connections for Ethernet IP
- 10 connections for FTP
- 2 connections for SNMP

The maximum number of simultaneous connections can not be exceeded. Existing connections must first be terminated before new ones can be set up. The ETHERNET Fieldbus Coupler is essentially equipped with two interfaces for data exchange:

- the interface to the fieldbus (Master)
- the interface to the I/O modules.

Data exchange takes place between the fieldbus master and the I/O modules.

If MODBUS is used as the fieldbus, the MODBUS master accesses the date using the MODBUS functions implemented in the fieldbus coupler; Ethernet/IP, in contrast, uses an object model for data access.

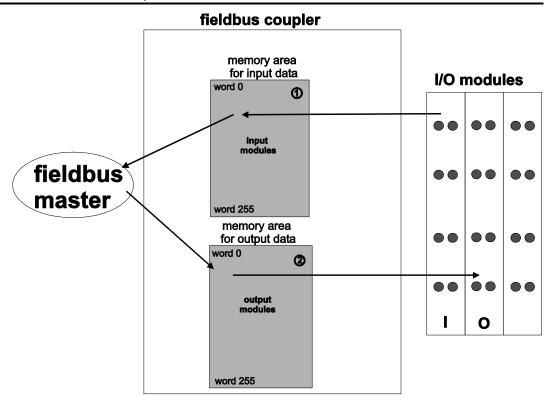

Figure 36: Memory Areas and Data Exchange

The fieldbus coupler process image contains the physical data for the bus modules.

These have a value of 0 ... 255 and word 512 ... 1275.

- 1 The input module data can be read by the CPU and by the fieldbus side.
- 2 Likewise, data can be written to the output modules from the CPU and the fieldbus side.

In addition, all output data is mirrored in the ETHERNET Fieldbus Coupler to a memory area with the address offset 0x0200 and 0x1000. This allows output values to be read back in by adding 0x0200 or 0x1000 to the MODBUS address.

## 7.3.1 Addressing

Module inputs and outputs in a fieldbus coupler are addressed internally as soon as they are started. The order in which the connected modules are addressed depends on the type of module that is connected (input module, output module). The process image is formed from these addresses.

The physical arrangement of the I/O modules in the fieldbus node is arbitrary.

#### 7.3.1.1 Addressing of I/O Modules

Addressing first references complex modules (modules that occupy several bytes) in accordance with their physical order downstream of the fieldbus coupler/controller; i.e., they occupy addresses starting from word 0.

Following these is the data for the remaining modules, compiled in bytes (modules that occupy less than one byte). In this process, byte by byte is filled with this data in the physical order. As soon a complete byte is occupied by the bit oriented modules, the process begins automatically with the next byte.

## **Note**

#### Hardware changes can result in changes of the process image!

I f the hardware configuration is changed and/or expanded; this may result in a new process image structure. In this case, the process data addresses also change. If adding modules, the process data of all previous modules has to be taken into account.

## Note

### Observe process data quantity!

For the number of input and output bits or bytes of the individual IO modules please refer to the corresponding description of the IO modules.

Table 25: Data Width for I/O Modules

| Data width > 1 byte (channel)      | Data width = 1 bit (channel)                             |
|------------------------------------|--|
| Analog input modules               | Digital input modules                                    |
| Analog output modules              | Digital output modules                                   |
| Input modules for thermocouples    | Digital output modules with diagnostics (2 bits/channel) |
| Input modules for resistor sensors | Supply modules with fuse carrier/diagnostics             |
| Pulse width output modules         | Solid-state load relays                                  |
| Interface modules                  | Relay output modules                                     |
| Up/down counters                   |  |
| I/O modules for angle and distance |  |
| measurement                        |  |

#### 7.3.1.2 IEC-61131-3 Address Areas

Subdivision of the address ranges for word-by-word addressing in accordance with IEC-61131-3:

# 7.3.2 Data Exchange between MODBUS/TCP Master and I/O Modules

Data exchange between the MODBUS/TCP Master and the I/O modules is conducted using the MODBUS functions implemented in the controller by means of bit-by-bit or word-by-word reading and writing routines.

There are 4 different types of process data in the controller:

- Input words
- Output words
- Input bits
- Output bits

Access by word to the digital I/O modules is carried out in accordance with the following table:

Table 26: Allocation of Digital Inputs and Outputs to Process Data Words in Accordance with the Intel Format

| Digital inputs/<br>outputs | 16.          | 15.       | 14.       | 13.       | 12.       | 11.       | 10.      | 9.       | 8.       | 7.       | 6.       | 5.       | 4.    | 3.    | 2.       | 1.    |
|----------------------------|--------------|-----------|-----------|-----------|-----------|-----------|----------|----------|----------|----------|----------|----------|-------|-------|----------|-------|
| Process data<br>word       | Bit<br>15    | Bit<br>14 | Bit<br>13 | Bit<br>12 | Bit<br>11 | Bit<br>10 | Bit<br>9 | Bit<br>8 | Bit<br>7 | Bit<br>6 | Bit<br>5 | Bit<br>4 | Bit 3 | Bit 2 | Bit<br>1 | Bit 0 |
| Byte                       | High byte D1 |           |           |           |           |           |          |          | L        | ow b     | yte D    | 0        |       |       |          |       |

Output can be read back in by adding an offset of  $200_{hex}$  (0x0200) to the MODBUS address.

## Note

### Data > 256 words can be read back by using the cumulative offset!

All output data greater than 256 words and, therefore located in the memory range 0x6000 to 0x62FC, can be read back by adding an offset of  $1000_{hex}$  (0x1000) to the MODBUS address.

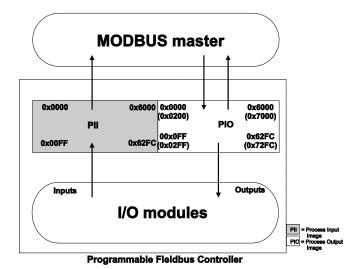

Figure 37: Data Exchange Between MODBUS Master and I/O Modules

Register functions start at address 0x1000. These functions can be addressed in a similar manner with the MODBUS function codes that are implemented (read/write).

The specific register address is then specified instead of the address for a module channel.

# Information

#### **Additional Information**

A detailed description of the MODBUS addressing may be found in Chapter "MODBUS Register Mapping".

# 7.3.3 Data Exchange between EtherNet/IP Master and I/O Modules

The data exchange between Ethernet/IP master and the I/O modules is objectoriented. Each node on the network is depicted as a collection of objects.

The "assembly" object specifies the structure of the objects for the data transmission. With the assembly object, data (e.g. I/O data) can be combined into blocks (mapped) and sent via a single message connection. Thanks to this mapping, less access to the network is necessary.

There is a distinction between input and output assemblies.

An input assembly reads in data from the application via the network or produces data on the network.

An output assembly writes data to the application or consumes data from the network.

In the fieldbus coupler/controller, various assembly instances are already preprogrammed (static assembly).

After the input voltage is applied, the assembly object combines data from the process image. As soon as a connection is established, the master can address the data with "class", "instance", and "attribute" and access it or read and write using I/O connections.

The mapping of the data depends on the assembly instance of the static assembly selected.

# Information

#### Additional Information:

The assembly instances for the static assembly are described in the section "Ethernet/IP".

# 8 Commissioning

This section shows a step-by-step procedure for starting up exemplarily a WAGO fieldbus node.

## Note

### Good example!

This description is just an example and only serves to describe the procedure for a local start-up of a single fieldbus node with a non-networked computer under Windows.

Two work steps are required for start-up. The description of these work steps can be found in the corresponding following sections.

- Connecting PC and fieldbus node
- Assigning the IP address to the fieldbus node

## Note

#### The IP address must occur in the network only once!

For error-free network communication, note that the assigned IP address must occur only once in the network!

In the event of an error, the error message "IP address configuration error" (error code 6 – error argument 7) is indicated by 'I/O' LED at the next power-on.

There are various ways to assign the IP address.

The various options are described in the following sections individually.

Following the commissioning descriptions after which the fieldbus node is ready for communication, the following topics are described:

- Preparing the Flash File System
- Restoring factory settings

## 8.1 Connecting Client PC and Fieldbus Nodes

- 1. Mount the fieldbus node on the TS 35 carrier rail. Follow the mounting instructions found in the "Mounting" section.
- 2. Connect the 24 V power supply to the supply terminals.
- 3. Connect the PC's ETHERNET interface to the fieldbus coupler's ETHERNET interface (RJ-45).
- 4. Turn the operating voltage on.

The fieldbus coupler is initialized. The coupler determines the I/O module configuration and creates a process image.

During start-up, the I/O LED (red) flashes.

If the I/O LED lights up green after a brief period, the fieldbus coupler is operational.

If an error has occurred during startup, a fault code is flashed by the I/O LED. If the I/O LED flashes 6 times (indicating error code 6) and then 4 times (indicating error argument 4), an IP address has not been assigned yet.

## 8.2 Allocating the IP Address to the Fieldbus Node

- Use address selection switch (DIP switch) to assign IP address (manually).
- Automatic assignment of addresses via DHCP (IP address via the fieldbus)
- Assigning IP Address via WAGO ETHERNET Settings (static IP address via the serial communication port)
- Assigning IP Address via BootP server (Static IP address via the fieldbus)

## 8.2.1 Assigning IP Address via Address Selection Switch

Use the address selection switch to set the host ID, i.e., the last byte of the IP address, which is entered in the Web-Based Management System on WBM page "TCP/IP", entry "DIP switch IP-Address", with values between 1 and 254 binary coded.

Example:

DIP switch IP address: 192.168.1
Set DIP switch value: 50 (binary coded: 00110010)
Resulting IP address saved in the fieldbus coupler: 192.168.1.50

## Note

### Host ID 1 - 254 via address selection switch freely adjustable!

Use the address selection switch to set the last byte of the IP address to a value between 1 and 254. The DIP switch is then enabled and the IP address is composed of the DIP switch base address stored in the fieldbus coupler and the host ID set on the DIP switch.

The IP address make via the Web-based Management System or WAGO-ETHERNET-Settings is disabled.

## Note

# Address selection switch values 0 and 255 are predefined, address selection switch disabled!

If you use the address selection switch to set the value 0 or 255, the address selection switch is disabled and the setting configured in the fieldbus coupler is used.

With the value 0, the settings of the Web based Management System or ETHERNET-Settings apply.

If you set the value 255, the configuration via DHCP is activated.

The base address used consists of the first three bytes of the IP address. This always depends on the DIP switch IP address currently saved in the fieldbus coupler.

If there is still no static IP address in the fieldbus coupler, the default value **192.168.1** defined by the firmware as the base address is used when setting the DIP switch to 1 - 254.

The address selection switch setting then overwrites the value of the host ID.

# Information

#### More information about changing the static base address

You can also change the base address currently saved in the fieldbus coupler as required.

Proceed as described in the section "Assigning IP Address via Web-Based Management System".

- 1. To configure the IP address via the address selection switch by setting the host ID (last position of the IP address) to a value that does not equal 0/255, first convert the host ID to the binary representation.

  For example, host ID 50 results in a binary code of 00110010.
- 2. Set the bits in sequence using the 8 address switches. Start with address switch 1 to set bit 0 (LSB) and end with address switch 8 for bit 7 (MSB).

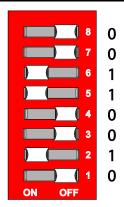

Figure 38: Address Selection Switch, for Example the Value Setting "50"  $(2^1 + 2^4 + 2^5)$ 

3. Restart the fieldbus coupler after adjusting the address selection switch to apply the configuration changes.

## 8.2.2 Assigning IP Address via DHCP

If you want to use DHCP to assign the IP address, it happens automatically via a DHCP server on the network.

## Note

Total network failure when there are two DHCP servers in the network! To prevent network failure, never connect a PC, on which a DHCP server is installed, to a global network. In larger networks, there is usually a DHCP server already that can cause collisions and subsequent network failure.

## Note

There must be a DHCP server in the network for further configuration! Install a DHCP server on your client PC in the local network if not already available. You can download a DHCP server free of charge on the Internet, e.g., http://windowspedia.de/dhcp-server\_download/.

## Note

**Assign the DHCP server a fixed IP address and note common subnet!** Note that the DHCP server must have a fixed IP address and that the fieldbus node and DHCP server must be in the same subnet.

# Note

#### Via DHCP assigned IP addresses are only temporarily valid!

Note that an IP address assigned via DHCP is limited in time. If the DHCP server is not available at the end of its useful life, the fieldbus node sets the IP address free and then the fieldbus node is no longer accessible!

#### The following step is included:

- Enable DHCP
- Assigning the IP address permanently by option "use IP from EEPROM"

#### 8.2.2.1 Enable DHCP

## Note

Set the address selection switch to 255 for active software configuration! Set the address selection switch to 255 to disable the DIP switch and to enable DHCP.

Restart the fieldbus node after adjusting the address selection switch to apply the configuration changes.

Alternatively, DHCP will be enabled on the internal Web pages or via WAGO-ETHERNET-Settings.

## Note

DHCP must be enabled on the Web pages or in WAGO-Ethernet-Settings! Note if an access to the internal Web pages of WBM is already possible via an IP address, you enable DHCP on the "Port" HTML page of the WBM, so is assigned via DHCP a new IP address. DHCP is not enabled by default when delivered. In other case you can also enable DHCP via WAGO-Ethernet-Settings in the Network tab.

An IP address is automatically assigned after restarting the fieldbus node.

# Information

More information about reading the IP address

You can use WAGO-ETHERNET-Settings, button [Identify], via Service Interface to read the IP addresses currently assigned.

# 8.2.2.2 Assigning the IP address permanently by option "use IP from EEPROM"

## Note

**IP stored in EEPROM must be used to assign the address permanently!** To apply the new IP address permanently in the fieldbus coupler, the option "use IP from EEPROM" must be selected. Thus, the IP address is automatically

entered as static address and used in the EEPROM.

You can enable the option "use IP from EEPROM" in the Web-based Management System.

- 1. Open the **Web browser** on your client (such as the Microsoft Internet Explorer) to have the HTML pages displayed.
- 2. Enter the **IP address** for your fieldbus node in the address line of the browser and press **[Return]**.
- 3. If a dialog window then appears with a password prompt, as Administrator, enter the user name: "admin" and the password "wago".

This is provided for secure access and entails three different user groups: admin, guest and user.

A start page is then displayed in the browser window with information about your fieldbus controller (start page can be changed on HTML page "Security").

You can navigate to other information using the hyperlinks in the left navigation bar.

4. In the left navigation bar click on **Port** to open the HTML page for selecting a protocol.

You are shown a list of all the protocols supported by the coupler.

- 5. Select the option "use IP from EEPROM".

  At the same time disables the use of DHCP server.
- 6. Confirm your changes with button [SUBMIT].
- 7. Then restart in order for the settings to take effect.
- 8. For a software reset, click in the left navigation bar on the link [Security] to open the HTML page on which you can set passwords and trigger a software reset.
- 9. Click on the button [Software Reset] at the bottom of the page.

Then the coupler/controller starts with the configurations, which were previously loaded into the EEPROM and the connection to the browser is interrupted.

10. Now you must use the changed IP address, if you want to access again on this device via browser.

## 8.2.3 Assigning IP Address via WAGO-ETHERNET-Settings

This program is used to configure an IP address via serial communications interface, to reset the fieldbus coupler parameters to the factory settings and to delete and extract the Flash File System in which the HTML pages of the fieldbus coupler are stored.

WAGO communication cables or WAGO radio-link adapters can be used for data communication

# **NOTICE**

#### Do not connect Communication Cable when energized!

To prevent damage to the communications interface, do not connect or disconnect 750-920 respectively 750-923 Communication Cable when energized! The fieldbus coupler/controller must be de-energized!

## Note

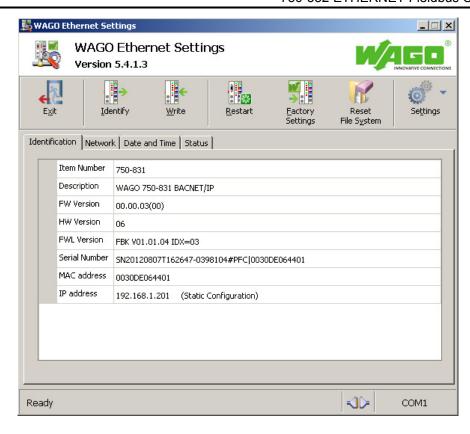

Set the address selection switch to 0 for active software configuration!

Set the address selection switch to 0 to disable the DIP switch and to enable the software configuration via ETHERNET-Settings.

Restart the fieldbus node after adjusting the switch to apply the configuration changes.

- 1. Using a WAGO Communication cable 750-920 respectively 750-923, connect your PC with the service interface of the fieldbus coupler.
- 2. Start **WAGO-ETHERNET-Settings** program.
- 3. Click on [Read] to read in and identify the connected fieldbus node.
- 4. Select the **Network** tab.

- 5. To assign a permanent address, select the option "Static configuration" in the field **Source** (BootP is the default).
- 6. Enter the required **IP Address** and, if applicable, the address of the subnet mask and gateway.
- 7. Click on the [Write] button to apply the settings in the fieldbus node.
- 8. You can now close ETHERNET-Settings or make other changes in the Web-based Management System as required. To open the Web-based Management System click on the button [WBM] on the right side.

## 8.2.4 Assigning the IP Address with a BootP Server

A BootP server or PLC program can be used to assign a fixed IP address.

Assigning the IP address using a BootP server depends on the respective BootP program. Handling is described in the respective manual for the program or in the respective integrated help texts.

# Note

#### Set the address selection switch to 0 for active software configuration!

Set the address selection switch to 0 to disable the DIP switch.

If an access to the internal Web pages of WBM is already possible via an IP address, then the software configuration via the WBM can be done.

In the default status, configuration via BootP is activated.

If not yet been assigned IP address, you can otherwise use WAGO-Ethernet-Settings or enable BootP in the **Network** tab of WAGO-Ethernet-Settings. Restart the fieldbus node after adjusting the address selection switch to apply the configuration changes.

## Note

## IP address assignment is not possible via the router!

The IP address is assigned via patch cable, switches, hubs, or via direct link using a crossover cable. Addresses cannot be assigned via routers.

## Note

### BootP must be enabled on the Web pages!

Note that BootP must be enabled on the internal Web pages of the WBM, HTML page "Port configuration".

BootP is enabled by default when delivered.

# Information

#### **Additional Information**

Assigning IP addresses using a BootP server can be carried out in any Windows and Linux operating system. Any other BootP servers may also be used, besides the WAGO-BootP server.

# Information

**More information about the WAGO-BootP-Server** The "WAGO-BootP-Server 759-315" is available free of charge at

http://www.wago.com.

#### The following steps are included:

Note MAC ID

- Note IP address
- Assigning the IP address and enable BootP
- Assigning the IP address permanently by option "use IP from EEPROM"

#### 8.2.4.1 Note MAC ID

Write down the coupler's MAC address (see label or peel-off strip).
 If the fieldbus is already installed, turn off the operating voltage of the fieldbus coupler, then take the fieldbus coupler out of the assembly of your fieldbus node and note the MAC ID of your fieldbus coupler.
 The MAC ID is applied to the back of the fieldbus coupler or on the self-adhesive peel-off strip on the side of the fieldbus coupler.

MAC ID of the fieldbus coupler: 0 0 : 3 0 : D E : \_\_ : \_\_ : \_\_ :

- 2. Plug the fieldbus coupler into the assembly of the fieldbus node.
- Use the fieldbus cable to connect the fieldbus connection of your mechanically and electrically assembled fieldbus node to an open interface on your PC.
   The PC must be equipped with a network card for this connection. The controller transfer rate then depends on the network card of your PC.
- 4. Start the PC that assumes the function of the master and BootP server.
- 5. Switch on the power at the fieldbus coupler (DC 24 V power supply unit).

The fieldbus coupler is initialized. The coupler determines the I/O module configuration and creates a process image.

During start-up, the I/O LED (red) flashes.

If the I/O LED lights up green after a brief period, the fieldbus coupler is operational.

If an error occurs during start-up indicated by the I/O LED flashing red, evaluate the error code and argument and resolve the error.

# Information

#### More information about LED signaling

The exact description for evaluating the LED signal displayed is available in the section "Diagnostics" > ... > "LED Signaling".

Error code 6, followed by error argument 4, is indicated by the I/O LED after coupler start-up with 6 red error code flashes, followed by four red flashes of the error argument. This indicates that an IP address has not yet been assigned.

#### 8.2.4.2 Determining IP addresses

- 1. If the PC is already integrated into an IP network, you can determine the PC's IP address by clicking on **Control Panel** from the **Start Menu** / **Settings**.
- 2. Double-click on the **Network** icon. The network dialog window appears.

#### For Windows 2000/XP:

- Select Network and Dial-Up Connections
- In the dialog window that then appears, right click on **LAN Connection** and open the **Properties** link.
- Mark the entry Internet Protocol (TCP/IP)

#### For Windows 7:

- Choose Network and Sharing Center by using Control Panel.
- In the dialog window that then appears, right click on **LAN Connection** and open the **Properties** link.
- Mark the entry **Internet Protocol V4**

## Note

#### Reinstall TCP/IP components if required!

If the "Internet Protocol TCP/IP" entry is missing, install the corresponding TCP/IP components and reboot your computer.

You will need the installation CD for Windows 2000, XP or 7.

- 3. Then click on the **Properties...** button
- 4. The IP address, subnet mask and, where required, the PC's gateway address appear in the Properties window. Note these values:

| PC IP address: |       |
|----------------|-------|
| Subnet mask:   |       |
| Gateway:       | · · · |

5. Now select the desired IP address for your fieldbus node.

## Note

#### Assign the PC a fixed IP address and note common subnet!

Note that the PC, on which the BootP server is listed, must have a fixed IP address and that the fieldbus node and PC must be in the same subnet.

| 6. | Note the II | address you | have se | lected: |
|----|-------------|-------------|---------|---------|
|----|-------------|-------------|---------|---------|

| Fieldbus node | IP address: | • |  |
|---------------|-------------|---|--|
|               |             |   |  |

#### 8.2.4.3 Assigning the IP address

- 1. Based on the handling, which depends on the BootP program set, assign the required IP address for your fieldbus node.
- 2. Enable the query/response mechanism of the BootP protocol based on the handling, which depends on the BootP program set. Alternatively, do the activation of BootP in WAGO-Ethernet-Settings or if an access to the internal Web pages of WBM is already possible via an IP address, in the Web-based management system.
- 3. To apply the new IP address, use e.g. a hardware reset to restart your fieldbus node by interrupt the voltage supply for approx. 2 seconds.

# 8.2.4.4 Assigning the IP address permanently by option "use IP from EEPROM"

When the BootP protocol is enabled the coupler expects the BootP server to be permanently available. If there is no BootP server available after a Power On reset, the network will remain inactive.

## **Note**

#### IP stored in EEPROM must be used to assign the address permanently!

To apply the new IP address permanently in the fieldbus coupler, the option "use IP from EEPROM" must be selected.

Thus, the IP address is automatically entered as static address and used in the EEPROM.

You can enable the option "use IP from EEPROM" in the Web-based Management System.

- 1. Open the **Web browser** on your client (such as the Microsoft Internet Explorer) to have the HTML pages displayed.
- 2. Enter the **IP address** for your fieldbus node in the address line of the browser and press [**Return**].
- 3. If a dialog window then appears with a password prompt, as Administrator, enter the user name: "admin" and the password "wago".

This is provided for secure access and entails three different user groups: admin, guest and user.

A start page is then displayed in the browser window with information about your fieldbus coupler (start page can be changed on HTML page "Security").

You can navigate to other information using the hyperlinks in the left navigation bar.

4. In the left navigation bar click on **Port** to open the HTML page for selecting a protocol.

You are shown a list of all the protocols supported by the coupler.

- 5. Select the "use IP from EEPROM" option.
  At the same time disables the request of BootP server.
- 6. Confirm your changes with button [SUBMIT].
- 7. Then restart in order for the settings to take effect.
- 8. For a software reset, click in the left navigation bar on the link [Security] to open the HTML page on which you can set passwords and trigger a software reset.
- 9. Click on the button [Software Reset] at the bottom of the page.

Then the coupler/controller starts with the configurations, which were previously loaded into the EEPROM and the connection to the browser is interrupted.

10. Now you must use the changed IP address, if you want to access again on this device via browser.

#### 8.2.4.5 Reasons for Failed IP Address Assignment

• The PC on whom the BootP server is running is not located in the same subnet as the fieldbus coupler; i.e., the IP addresses do not match.

Example:

Sub net mask: 255.255.255.0 (default value for fieldbus coupler)

PC IP: <u>192.168.2.</u>100 Fieldbus coupler IP: <u>192.168.2.</u>100

Due to the sub net mask, the first 3 digits of the IP addresses must match.

- PC and/or coupler is/are not linked to the ETHERNET
- Poor signal quality (use switches or hubs)

## 8.3 Testing the Function of the Fieldbus Node

# Information

#### More information about reading the IP address

You can use WAGO-ETHERNET-Settings, button [Identify], via Service Interface to read the IP addresses currently assigned.

- 1. To ensure that the IP address is correct and to test communication with the fieldbus node, first turn off the operating voltage of the fieldbus node.
- 2. Create a non-serial connection between your client PC and the fieldbus node.

The fieldbus coupler is initialized. The coupler determines the I/O module configuration and creates a process image.

During start-up, the I/O LED (red) flashes.

If the I/O LED lights up green after a brief period, the fieldbus coupler is operational.

If an error occurs during start-up indicated by the I/O LED flashing red, evaluate the error code and argument and resolve the error.

# Information

#### More information about LED signaling

The exact description for evaluating the LED signal displayed is available in the section "Diagnostics" > ... > "LED Signaling".

- 3. To test the coupler's newly assigned I/P address, start a DOS window by clicking on the **Start** menu item **Programs/MS-DOS Prompt**.
- 4. In the DOS window, enter the command: "**ping** " followed by the IP address of your coupler in the following format:

ping [space] XXX . XXX . XXX . XXX (=IP address)

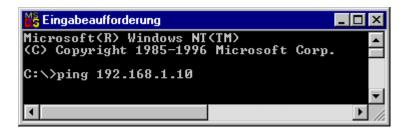

Figure 39: Example for the Function test of a Fieldbus Node

5. When the **[Enter]** key has been pressed, your PC will receive a query from the coupler, which will then be displayed in the DOS window.

If the error message: "Timeout" appears, please compare your entries again to the allocated IP address and check all connections.

6. When the test has been performed successfully, you can close the DOS prompt.

The fieldbus node is now ready for communication.

## 8.4 Preparing the Flash File System

The flash file system must be prepared in order to use the Web interface of the fieldbus coupler to make all configurations.

The flash file system is already prepared when delivered.

However, if the flash file system has not been initialized on your fieldbus coupler or it has been destroyed due to an error, you must first extract it to the flash memory to access it.

## NOTICE

#### Do not connect Communication Cable when energized!

To prevent damage to the communications interface, do not connect or disconnect 750-920 respectively 750-923 Communication Cable when energized! The fieldbus coupler/controller must be de-energized!

## Note

#### Formatting erases data!

Note that formatting erases all data and configurations.

Only use this function when the flash file system has not been initialized yet or has been destroyed due to an error.

- 1. Switch off the supply voltage of the fieldbus coupler.
- 2. Connect the communication cable 750-920 or 750-923 respectively the  $Bluetooth^{\text{®}}$  Adapter 750-921 to the configuration interface of the fieldbus coupler and to your computer.
- 3. Switch on the supply voltage of the fieldbus coupler.

The fieldbus coupler is initialized. The coupler determines the I/O module configuration and creates a process image.

During start-up, the I/O LED (red) flashes.

If the I/O LED lights up green after a brief period, the fieldbus coupler is operational.

If an error occurs during start-up indicated by the I/O LED flashing red, evaluate the error code and argument and resolve the error.

# Information

#### More information about LED signaling

The exact description for evaluating the LED signal displayed is available in the section "Diagnostics" > ... > "LED Signaling".

4. Start the **WAGO-ETHERNET-Settings** program.

5. In the top menu bar, select **Reset File System** to format the file system and to extract the Web pages of the flash file system.

Formatting and extracting is complete when the status window displays "Resetting the file system successfully".

# Note

Restart the Fieldbus coupler/controller after resetting file system! Make a restart of the fieldbus coupler/controller, so that the Web pages can be displayed after resetting file system.

To restore the factory settings, proceed as follows:

- 1. Switch off the supply voltage of the fieldbus coupler.
- 2. Connect the communication cable 750-920 or 750-923 respectively the *Bluetooth*® Adapter 750-921 to the configuration interface of the fieldbus coupler and to your computer.
- 3. Switch on the supply voltage of the fieldbus coupler.
- 4 Start the **WAGO-ETHERNET-Settings** program.
- 5. In the top menu bar, select [Factory Settings] and click [Yes] to confirm.

A restart of the fieldbus node is implemented automatically. The start takes place with the default settings.

# 9 Configuring via the Web-Based Management System (WBM)

An internal file system and an integrated Web server can be used for configuration and administration of the system. Together, they are referred to as the Web-based Management System (WBM).

The HTML pages saved internally provide you with information about the configuration and status of the fieldbus node. In addition, you can also change the configuration of the device here.

You can also save HTML pages created yourself via the implemented file system.

## Note

## Always restart after making changes to the configuration!

The system must always be restarted for the changed configuration settings to take effect.

- 1. To open the WBM, launch a Web browser (e.g., Microsoft Internet Explorer or Mozilla Firefox).
- 2. Enter the IP address of the fieldbus coupler/controller in the address bar.
- 3. Click **[Enter]** to confirm. The start page of WBM loads.
- 4. Select the link to the desired HTML page in the left navigation bar. A query dialog appears.
- 5. Enter your user name and password in the query dialog (default: user = "admin", password = "wago" or user = "user", password = "user"). The corresponding HTML page is loaded.
- 6. Make the desired settings.
- 7. Press [SUBMIT] to confirm your changes or press [UNDO] to discard the changes.
- 8. Restart the system to apply the settings (HTML page "Security", button [Software Reset]).

You can access the following WBM pages via the links given in the navigation bar:

- Information
- Ethernet
- TCP/IP
- Port
- SNMP
- SNMP V3
- Watchdog
- Security
- Modbus
- EtherNet/IP
- Features
- I/O config
- Disk Info

## 9.1 Information

The WBM page "Information" contains an overview of all important information about your fieldbus coupler/controller.

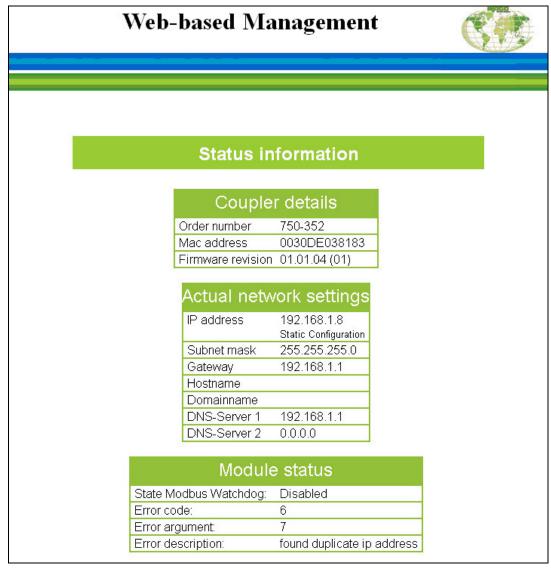

Figure 40: WBM page "Information" (example)

Table 27: WBM Page "Information"

| Coupler details          | Coupler details     |                                      |   |  |  |  |  |  |
|--------------------------|---------------------|--------------------------------------|---|--|--|--|--|--|
| Entry                    | Default             | Value (example)                      | Description   |  |  |  |  |  |
| Order number             | 750-352             | 750-352                              | Order number  |  |  |  |  |  |
| Mac address              | 0030DEXXXXXX        | 0030DE000006                         | Hardware MAC address  |  |  |  |  |  |
| Firmware revision        | kk.ff.bb (rr)       | 01.01.09 (00)                        | Firmware revision number (kk = compatibility, ff = functionality, bb = bugfix, rr = revision) |  |  |  |  |  |
| Actual network           | settings            |                                      |   |  |  |  |  |  |
| Entry                    | Default             | Value (example)                      | Description   |  |  |  |  |  |
| IP address               | 0.0.0.0             | 192.168.1.80                         | IP address,<br>Type of IP address assignment  |  |  |  |  |  |
| Subnet mask              | 255.255.255.0       | 255.255.255.240                      | Subnet mask   |  |  |  |  |  |
| Gateway                  | 0.0.0.0             | 192.168.1.251                        | Gateway   |  |  |  |  |  |
| Host name                |                     |                                      | Host name (not assigned here)   |  |  |  |  |  |
| Domain name              |                     |                                      | Domain name (not assigned here)   |  |  |  |  |  |
| DNS server 1             | 0.0.0.0             | 0.0.0.0                              | Address of first DNS server   |  |  |  |  |  |
| DNS server 2             | 0.0.0.0             | 0.0.0.0                              | Address of second DNS server  |  |  |  |  |  |

|  |                         |      | ☑ Enable "Fast Aging"  |  |  |  |  |
|  |                         |      | "Fast Aging" ensures that the cache for the MAC  |  |  |  |  |
| Fast Aging                                   |                         |      | addresses is cleared faster in the switch. This may be   |  |  |  |  |
|  |                         |      | required if a redundancy system (e.g., using a Jet-  |  |  |  |  |
| 1 401 / 151115                               |                         |      | Ring network or comparable technology) needs to be   |  |  |  |  |
|  |                         |      | set up.  |  |  |  |  |
|  |                         |      | Disable "Fast Aging".  |  |  |  |  |
|  |                         |      | The time to discard the cache entries is five minutes.   |  |  |  |  |

| BC protection |   |      |   | Broadcast Protection limits the number of broadcast telegrams per unit of time. If protection is on, the broadcast packets are limited at 100 Mbit to 8 packets per 10 ms and at 10 Mbit to 8 packets per 100 ms. If the limit is exceeded, packets are lost. |  |
|---------------|---|------|---|---|--|
|               |   |      |   | ☐ Broadcast Protection disabled.  |  |
| Port Mirror   |   |      |   | Enable port mirroring Port Mirroring is used for network diagnostics. Packets are mirrored from one port (mirror port) to another (sniffer port).   |  |
|               |   |      |   | ☐ Disable port mirroring  |  |
| Sniffer Port  | 0 | 0    |   | Select the sniffer port the mirror port should be mirrored to.  |  |
| Mirror Port   | 0 | 0    | 0 | Select the mirror port which should be mirrored to the sniffer port.  |  |
| Ethernet MTU  |   | 1500 |   | Maximum packet size of a protocol, which can be transferred without fragmentation ("Maximum Transmission Unit" - MTU)   |  |

# Note

### Set the MTU value for fragmentation only!

Only set the value for MTU, i.e., the maximum packet size between client and server, if you are using a tunnel protocol (e.g., VPN) for ETHERNET communication and the packets must be fragmented.

Setting the value is independent of the transmission mode selected.

# Note

#### Configure ETHERNET transmission mode correctly!

A fault configuration of the ETHERNET transmission mode may result in a lost connection, poor network performance or faulty performance of the fieldbus coupler/controller.

# Note

### All ETHERNET ports cannot be disabled!

Both ETHERNET ports can be switched off. If both ports are disabled and you press [SUBMIT], the selection is not applied and the previous values are restored.

## 9.3 TCP/IP

You can configure network addressing and network identification on the "TCP/IP" HTML page.

## **Note**

#### Set the DIP switch to "0" and enable "use IP from EEPROM"!

Before you change parameters on this page, set the DIP switch to zero and on the "Port" WBM page, set the "use IP from EEPROM" option!

If these conditions are not met, the DIP switch settings are applied instead.

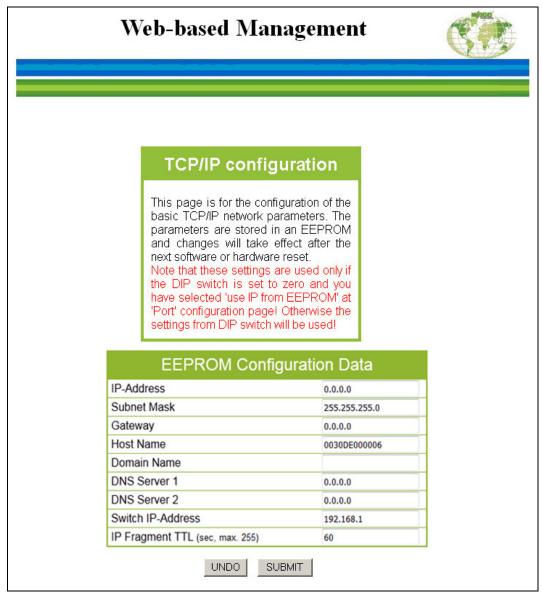

Figure 42: WBM page "TCP/IP"

Table 29: WBM Page "TCP/IP"

| EEPROM Configuration Data       |                  |                    |   |  |  |  |  |  |
|---------------------------------|------------------|--------------------|---|--|--|--|--|--|
| Entry                           | Default          | Value<br>(example) | Description   |  |  |  |  |  |

# Note

## Alternative IP address assignment!

You can only select the DHCP, BootP and "use IP from EEPROM" settings as an alternative!

#### 9.5 SNMP

On the HTML page "SNMP", you can perform the settings for the Simple Network Management Protocol.

SNMP is a standard for device management within a TCP/IP network. The Simple Network Management Protocol (SNMP) is responsible for transporting the control data that allows the exchange of management information, the status and statistic data between individual network components and a management system.

The fieldbus coupler/controller supports SNMP in versions 1, 2c and 3.

The SNMP of the ETHERNET TCP/IP coupler includes the general MIB according to RFC1213 (MIB II).

SNMP is processed via port 161. The port number for SNMP traps (agent messages) is 162.

### Note

### Enable port 161 and 162 to use SNMP!

Enable ports 161 and 162 in the WBM in menu "port", so that the fieldbus coupler/controller can be reached via SNMP. The port numbers cannot be modified.

# Note

### Modify parameter via WBM or SNMP objects!

However, parameters that can be set on the html pages can also be changed directly by the appropriate SNMP objects.

## Information

#### **Additional Information:**

Additional information for SNMP, the Management Information Base (MIB) and traps (event messages via SNMP) may be obtained from section "Fieldbus Communication" > ... > "SNMP (Simple Network Management Protocol)."

Note that the settings for SNMPV1/V2c and SNMPV3 are separate from each other: The different SNMP versions can be activated or used in parallel or individually on a fieldbus coupler.

### 9.5.1 SNMP V1/V2c

The SNMP version 1/2c represents a community message exchange. The community name of the network community must thereby be specified.

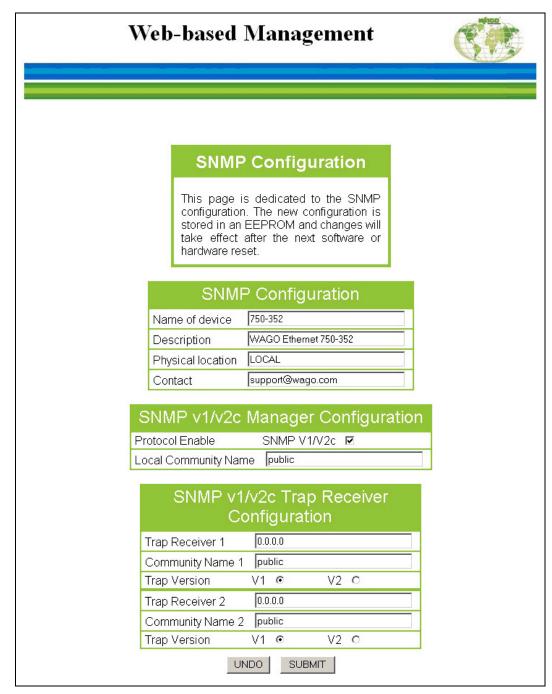

Figure 44: WBM page "SNMP" (example)

Table 31: WBM Page "SNMP"

| SNMP Configuration      | SNMP Configuration                      |   |   |  |  |

### 9.5.2 SNMP V3

In SNMP version 3, exchanging messages is user-related. Each device, that knows the passwords set via WBM, may read or write values from the fieldbus coupler/-controller.

In SNMP V3, user data from SNMP messages can also be transmitted in encoded form. This is why SNMP V3 is often used in safety-related networks.

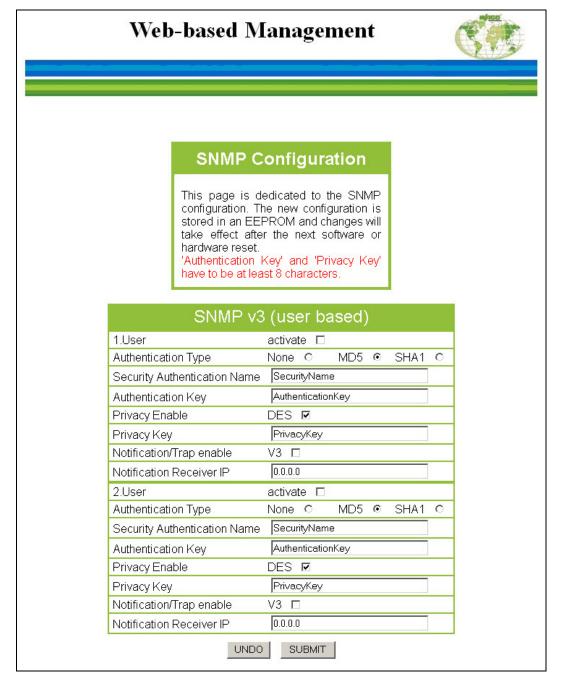

Figure 45: WBM page "SNMP V3"

Table 32: WBM Page "SNMP V3"

|                                      | SNMP v3 (user based)             |  |  |  |
|--------------------------------------|----------------------------------|--|--|--|
| Entry                                | Value<br>(Example)               | Description  |  |  |
| 1. User / 2. User                    | activate 🔽                       | Activating user 1 or 2   |  |  |

Two independent SNMPv3 users can be defined and activated via the html page (user 1 and user 2).

## 9.6 Watchdog

Click the link "Watchdog" to go to a Web site where you can specify the settings for the connection and MODBUS watchdog.

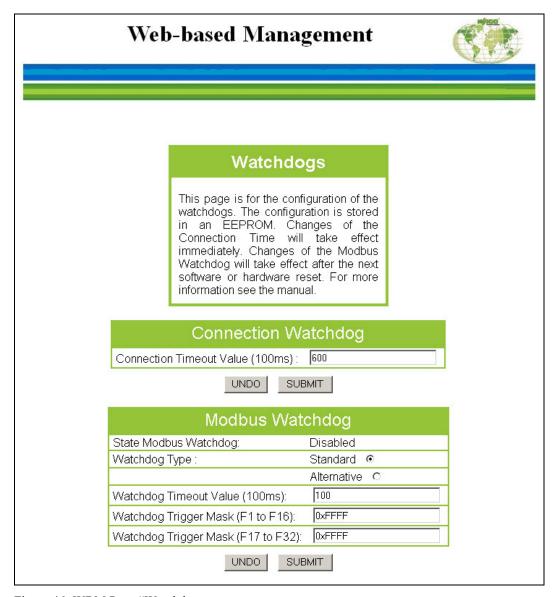

Figure 46: WBM Page "Watchdog"

Table 33: WBM Page "Watchdog"

| Connection watchdog                   | Connection watchdog |   |  |  |  |
|---------------------------------------|---------------------|---|--|--|--|
| Entry                                 | Default             | Description   |  |  |  |
| Connection Timeout Value (100 ms)     | 600                 | Monitoring period for TCP links. After the completion of this period without any  |  |  |  |
|                                       |                     | subsequent data traffic, the TCP connection is closed.  |  |  |  |
| Modbus Watchdog                       | •                   |   |  |  |  |
| Entry                                 | Default             | Description   |  |  |  |
| State Modbus Watchdog                 | Disabled            | Enabled – Watchdog is activated Disabled – Watchdog is disabled   |  |  |  |
| Watchdog Type                         | Standard •          | The set coding mask (watchdog trigger mask) is evaluated to determine whether the watchdog time is reset.   |  |  |  |
|                                       | Alternative O       | The watchdog time is reset by any Modbus/TCP telegram.  |  |  |  |
| Watchdog Timeout Value (100 ms)       | 100                 | Monitoring period for Modbus links. After the completion of this period without receiving a Modbus telegram, the physical outputs are set to "0". |  |  |  |
| Watchdog Trigger Mask<br>(F 1 to F16) | 0xFFFF              | Coding mask for certain Modbus telegrams (Function Code FC1 FC16)   |  |  |  |
| Watchdog Trigger Mask<br>(F17 to F32) | 0xFFFF              | Coding mask for certain Modbus telegrams (Function Code FC17 FC32)  |  |  |  |

#### 9.7 **Security**

Use the "Security" HTML page with passwords to set up read and/or write access for various user groups to protect against configuration changes.

## Note

Passwords can only be changed by "admin" and after software reset!

The "admin" user and associated password are required to change passwords. Press the [Software Reset] button to restart the software for the setting changes to take effect.

## Note

### Note password restrictions!

The following restriction is applied for passwords:

Max. 32 characters inclusive special characters.

## Note

### Renew access after software reset!

If you initiate a software reset on this page, then the fieldbus coupler/controller starts with the configurations previously loaded into the EEPROM and the connection to the browser is interrupted.

If you changed the IP address previously, you have to use the changed IP address to access the device from the browser.

You have not changed the IP address and performed other settings; you can restore the connection by refreshing the browser.

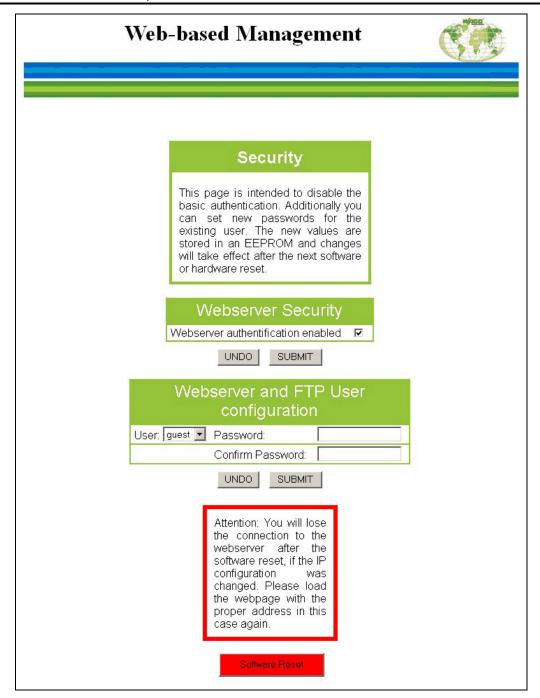

Figure 47: WBM page "Security"

Table 34: WBM Page "Security"

| Webserver Security       |   |   |  |  |
|--------------------------|---|---|--|--|
| Entry                    | <b>Default Description</b>              |   |  |  |

| User                     | *)                                      | Select admin, guest or user                             |  |  |
| Password                 | *)                                      | Enter password  |  |  |
| Confirm password         |   | Enter password again to confirm                         |  |  |

\*) The following default groups exist:

User: admin Password: wago User: guest Password: guest User: user Password: user

#### 9.8 **MODBUS**

Use the "MODBUS" HTML page to specify the settings for the MODBUS protocol.

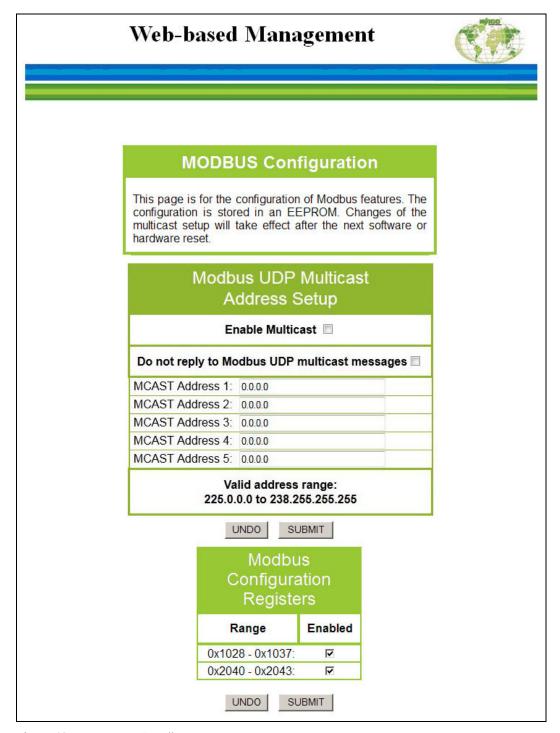

Figure 48: WBM page "Modbus"

Table 35: WBM page "Modbus"

| Modbus UDP Mu                 | Modbus UDP Multicast Address Setup |  |  |  |
|-------------------------------|------------------------------------|--|--|--|
| Entry                         | Default value                      | Description  |  |  |
| Enable Multipost              |                                    | ☐ Enable Multicast for MODBUS UDP transmission. In addition to its own IP address, the fieldbus coupler receives MODBUS commands for the following registered MCAST addresses. |  |  |
| Enable Multicast              |                                    | Multicast for MODBUS UDP transmission is not enabled. The fieldbus coupler receives MODBUS commands only for the own IP address.   |  |  |
| Do not reply to<br>Modbus UDP | П                                  | The reply to Modbus UDP multicast messages is deactivated.   |  |  |
| multicast messages            |                                    | The reply to Modbus UDP multicast messages is activated.   |  |  |
| MCAST Address 1 5:            | 0.0.0.0                            | Multicast address 1 5, for the multicast will be enabled. The valid address range is shown in the WBM. Multiple assigned addresses are not valid.                              |  |  |

| Modbus Configuration Registers              |               |   |  |
|---|---------------|---|--|
| Entry                                       | Default value | Description   |  |
| Range<br>0x1028 - 0x1037<br>0x2040 - 0x2043 |               | <ul> <li>☑ Enable MODBUS configuration register range.</li> <li>☑ Disable MODBUS configuration register range.</li> </ul> |  |

## Note

### Multicast function only with a valid MCAST address active!

Activate the function "Enable Multicast", without you enter an address not equal to 0.0.0.0, the function is automatically deactivated, after a click on the [SUBMIT] button.

If the function "Enable Multicast" is already enabled with valid addresses, you can not describe this MCAST address fields with invalid addresses, because of a click on the [SUBMIT] button resets to the last valid addresses. Thereby, the function "Enable Multicast" maintains its State.

### 9.9 EtherNet/IP

Use the "EtherNet/IP" HTML page to configure the optional padding of the static assembly instances and to get a list with the present data distribution for the exchange of process data via the EtherNet/IP communication.

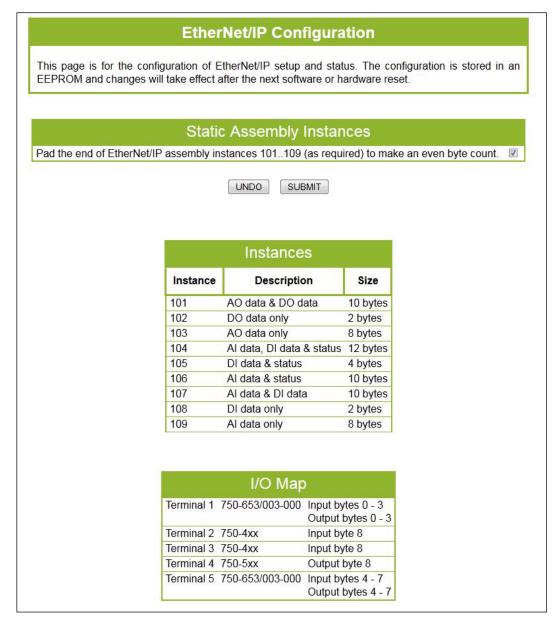

Figure 49: WBM page "EtherNet/IP"

| Γable 36: WBM page "EtherNet/IP"  |                           |                                       |   |  |
|---|---------------------------|---------------------------------------|---|--|
| Static Assembly Instances   |                           |                                       |   |  |
| Entry   | Default value Description |                                       |   |  |
| Pad the end of<br>EtherNet/IP assembly<br>instances 101109 (as<br>required) to make an even |                           | instances 101109<br>make an even byte | end of EtherNet/IP assembly 9 (as required) is activated, to count. EtherNet/IP assembly instances. |  |

#### **Features** 9.10

Terminal 2

Use the "Features" HTML page to enable or disable additional functions.

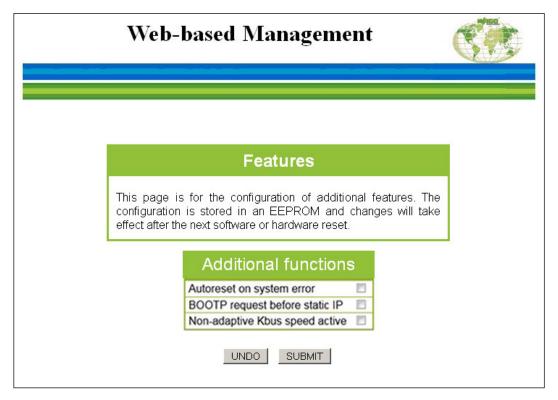

Figure 50: WBM Page "Features"

Table 37: WBM Page "Features"

| Additional functions              |         |   |  |
|-----------------------------------|---------|---|--|
| Entry                             | Default | Description   |  |
| Autoreset on                      |         | enables an automatic software reset to be conducted when a system error occurs  |  |
| system error                      |         | disables an automatic software reset to be conducted when a system error occurs   |  |
| BootP Request<br>before Static-IP |         | Automatically set the static IP address enabled.  For this configuration, the fieldbus coupler/ controller uses a statically configured IP address if the request via BootP fails.  |  |
|                                   |         | Automatically set the static IP address disabled.  For this configuration, the IP address request via BootP is repeated in the event of error.  |  |
| Non-adaptive Kbus speed active    |         | Disable the rate adjustment of the internal bus for short fieldbus nodes. With short fieldbus nodes, doing so makes more computing power available for the PLC application. The internal bus rate is correspondingly lower. |  |
|                                   |         | ☐ Enables the rate adjustment of the internal bus.  |  |

## 9.11 I/O Config

Click the link "I/O config" to view the number of modules that are connected to your hardware.

The data in the second line are not relevant for the present fieldbus coupler, because software-technical hardware configuration is not performed in a fieldbus coupler. You always find the value "0" for the number of modules in the I/O configuration.

# Note

### Hardware Configuration will not be performed in a fieldbus coupler!

Note that you do not need to perform a software-technical hardware configuration of a fieldbus coupler, this is only necessary for the functionality of a programmable fieldbus controller in an application.

## Web-based Management

### I/O configuration

| Configuration details                  |   |  |  |
|--|---|--|--|
| Number of modules on terminalbus       | 4 |  |  |
| Number of modules in I/O configuration | 0 |  |  |

#### 10 **Diagnostics**

#### **LED Signaling** 10.1

For on-site diagnostics, the fieldbus coupler has several LEDs that indicate the operational status of the fieldbus coupler or the entire node (see following figure).

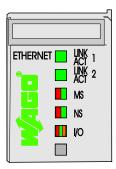

Figure 53: Display Elements

The diagnostics displays and their significance are explained in detail in the following section.

The LEDs are assigned in groups to the various diagnostics areas:

Table 40: LED Assignment for Diagnostics

| Diagnostics area | LEDs  |
|------------------|---|
| Fieldbus status  | <ul><li>LINK ACT Port 1</li><li>LINK ACT Port 2</li><li>MS</li><li>NS</li></ul> |
| Node status      | • I/O   |

#### 10.1.1 **Evaluating Fieldbus Status**

The health of the ETHERNET Fieldbus is signaled through the top LED group ('LINK ACT 1, 2', 'MS', und 'NS').

The two-colored LEDs 'MS' (module status) and 'NS' (network status) are solely used by the Ethernet/IP protocol. These two LEDs conform to the Ethernet/IP specifications.

Table 41: Fieldbus Diagnostics - Solution in Event of Error

| LED<br>Status         | Meaning   | Solution   |  |  |
|-----------------------|---|--|--|--|
| LINK ACT 1, 2         |   |  |  |  |

#### 10.1.2 **Evaluating Node Status – I/O LED (Blink Code Table)**

The communication status between fieldbus coupler/controller and the I/O modules is indicated by the I/O LED.

Table 42: Node Status Diagnostics – Solution in Event of Error

| LED Status                  | Meaning   | Solution   |  |
|-----------------------------|---|--|--|
| I/O                         |   |  |  |
| green                       | The fieldbus node is operating correctly.   | Normal operation.  |  |
| orange<br>flashing          | Start of the firmware. 1 2 seconds of rapid flashing indicate start-up.   | -  |  |
| red                         | Fieldbus coupler/controller hardware defect   | Replace the fieldbus coupler/controller.   |  |
| red<br>flashing             | Flashing with approx 10 Hz indicates the initialization of the internal bus or of a internal bus error.                       | Note the following flashing sequence.  |  |
| red<br>cyclical<br>flashing | Up to three successive flashing sequences indicate internal data bus errors. There are short intervals between the sequences. | Evaluate the flashing sequences based on the following blink code table.  The blinking indicates an error message comprised of an error code and error argument. |  |
| off                         | No data cycle on the internal bus.  | The fieldbus coupler/controller supply is off.   |  |

Device boot-up occurs after turning on the power supply. The I/O LED flashes orange.

Then the bus is initialized. This is indicated by flashing red at 10 Hz for 1 ... 2 seconds.

After a trouble-free initialization, the I/O LED is green.

In the event of an error, the I/O LED continues to blink red. Blink codes indicate detailed error messages. An error is indicated cyclically by up to 3 flashing sequences.

After elimination of the error, restart the node by turning the power supply of the device off and on again.

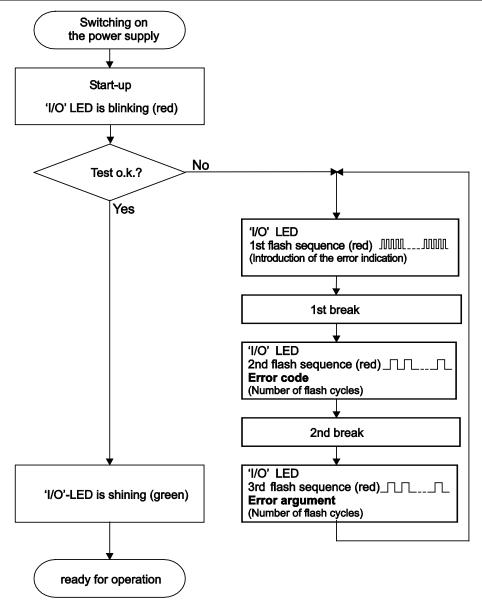

Figure 54: Node Status – I/O LED Signaling

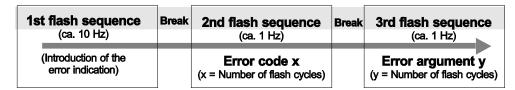

Figure 55: Error Message Coding

### **Example of a module error:**

- The I/O LED starts the error display with the first flashing sequence (approx. 10 Hz).
- After the first break, the second flashing sequence starts (approx. 1 Hz):
   The I/O LED blinks four times.
   Error code 4 indicates "data error internal data bus".

After the second break, the third flashing sequence starts (approx. 1 Hz): The I/O LED blinks twelve times. Error argument 12 means that the internal data bus is interrupted behind the twelfth I/O module.

The thirteenth I/O module is either defective or has been pulled out of the assembly.

Table 43: Blink Code Table for the 'I/O' LED Signaling, Error Code 1

| 9                 | Error with mapping between bus modules and fieldbus | Check EA-Config.xml file on the fieldbus coupler   |  |

#### **Fault Behavior** 10.2

#### Fieldbus Failure 10.2.1

A field bus failure is given i. e. when the master cuts-out or the bus cable is interrupted. A fault in the master can also lead to a fieldbus failure.

A field bus failure is indicated when the red "ERROR"-LED is illuminated.

If the watchdog is activated, the fieldbus coupler firmware evaluates the watchdog-register in the case of fault free communication, and the coupler answers all following MODBUS TCP/IP requests with the exception code 0x0004 (Slave Device Failure).

| T          |   |              |
|------------|---|--------------|
|            |   |              |
| L          |   |              |
| ]          | <b>Further Information</b>                                |              |
| <b>'</b> ] | For detailed information on the Watchdog register see Cha | pter "MODBUS |
| ]          | Functions"; "Watchdog (Fieldbus failure)".                |              |

#### 10.2.2 **Internal Data Bus Failure**

'I/O' LED indicates an internal bus failure

#### 'I/O' LED flashed red:

When an internal data bus failure occurs, the fieldbus coupler generates an error message (error code and error argument).

An internal data bus failure occurs, for example, if an I/O module is removed. If the error occurs during operation, the output modules operate as they do during an internal data bus stop.

If the internal data bus error is resolved, the coupler starts up after turning the power off and on similar to that of a normal start-up. The process data is transmitted again and the outputs of the node are set accordingly.

If the "KBUS ERROR INFORMATION" function block is evaluated in the control program, then the "ERROR", "BITLEN", "TERMINALS" and "FAILADDRESS" output values are relevant.

**ERROR** = FALSE= No fault = Bit length of the internal bus shift register (BITLEN **TERMINALS** = Number of I/O modules) **ERROR** = TRUE= Internal Bus Error = 0(BITLEN = 0**TERMINALS FAILADRESS** = Position of the I/O module after which the internal bus interruption arose, similar to the flashed error argument of the I/O LED)

### 11 Fieldbus Communication

Fieldbus communication between master application and a WAGO fieldbus coupler/controller based on the ETHERNET standard normally occurs via an implemented fieldbus-specific application protocol.

Depending on the application, this can be e.g., MODBUS/TCP (UDP), EtherNet/IP, BACnet/IP, KNXnet/IP, PROFINET, sercos or other.

In addition to the ETHERNET standard and the fieldbus-specific application protocol, there are also other communications protocols important for reliable communication and data transmission and other related protocols for configuring and diagnosing the system implemented in the WAGO fieldbus coupler/controller based on ETHERNET.

These protocols are explained in more detail in the other sections.

## 11.1 Implemented Protocols

### 11.1.1 Communication Protocols

### 11.1.1.1 IP (Internet Protocol)

The Internet protocol divides datagrams into segments and is responsible for their transmission from one network subscriber to another. The stations involved may be connected to the same network or to different physical networks which are linked together by routers.

Routers are able to select various paths (network transmission paths) through connected networks, and bypass congestion and individual network failures. However, as individual paths may be selected which are shorter than other paths, datagrams may overtake each other, causing the sequence of the data packets to be incorrect.

Therefore, it is necessary to use a higher-level protocol, for example, TCP to guarantee correct transmission.

#### **IP Packet**

In addition to the data units to be transported, the IP data packets contain a range of address information and additional information in the packet header.

Table 49: IP Packet

|  | IP Header    | IP Data  |
|--|--------------|----------|
|  | i i P Header | I P DATA |
|  |              |          |

The most important information in the IP header is the IP address of the transmitter and the receiver and the transport protocol used.

#### **IP Addresses**

To allow communication over the network each fieldbus node requires a 32 bit Internet address (IP address).

## Note

### IP Address must be unique!

For error free operation, the IP address must be unique within the network. The same IP address may not be assigned twice.

As shown below there are various address classes with net identification (net ID) and subscriber identification (subscriber ID) of varying lengths. The net ID defines the network in which the subscriber is located. The subscriber ID identifies a particular subscriber within this network.

Networks are divided into various network classes for addressing purposes:

• Class A: (Net ID: Byte 1, Host ID: Byte 2... Byte 4)

Table 50: Network Class A

| e. g. | 101      | . 16     | . 232    | . 22     |
|-------|----------|----------|----------|----------|
|       | 01100101 | 00010000 | 11101000 | 00010110 |
| 0     | Net ID   |          | Host ID  |          |

The highest bit in Class A networks is always '0'. This means the highest byte can be in a range of '0 0000000' to '0 11111111'.

Therefore, the address range of a Class A network in the first byte is always between 0 and 127.

• Class B: (Net ID: Byte 1 ... Byte 2, Host ID: Byte 3... Byte 4)

Table 51: Network Class B

| e. g. | 181      | . 16     | . 232    | . 22     |
|-------|----------|----------|----------|----------|
|       | 10110101 | 00010000 | 11101000 | 00010110 |
| 10    | Net ID   |          | Hos      | t ID     |

The highest bits in Class B networks are always '10'. This means the highest byte can be in a range of '10 000000' to '10 111111'.

Therefore, the address range of Class B networks in the first byte is always between 128 and 191.

• Class C: (Net ID: Byte 1 ... Byte 3, Host ID: Byte 4)

Table 52: Network Class C

| e.g. | 201      | . 16     | . 232    | . 22     |
|------|----------|----------|----------|----------|
|      | 11000101 | 00010000 | 11101000 | 00010110 |
| 110  | Net ID   |          |          | Host ID  |

The highest bits in Class C networks are always '110'. This means the highest byte can be in a range of '110 00000' to '110 11111'.

Therefore, the address range of Class C networks in the first byte is always between 192 and 223.

• Additional network classes (D, E): are only used for special tasks.

### **Key Data**

Table 53: Key Data Class A, B and C

| Network Class | Address range of                   | Possible number of                     |                                       |
|---------------|------------------------------------|--|---------------------------------------|
|               | the subnetwork                     | Networks                               | Hosts per<br>Network                  |
| Class A       | 0.XXX.XXX.XXX<br>127.XXX.XXX.XXX   | 128<br>(2 <sup>7</sup> )               | Approx. 16 Million (2 <sup>24</sup> ) |
| Class B       | 128.000.XXX.XXX<br>191.255.XXX.XXX | Approx. 16 Thousand (2 <sup>14</sup> ) | Ca. 65 Thousand (2 <sup>16</sup> )    |
| Class C       | 192.000.000.XXX<br>223.255.255.XXX | Approx. 2 Million (2 <sup>21</sup> )   | 254<br>(2 <sup>8</sup> )              |

Each WAGO ETHERNET fieldbus coupler or controller can be easily assigned an IP address via the implemented BootP protocol. For small internal networks we recommend selecting a network address from Class C.

## Note

#### Do not set IP addresses to 0.0.0.0 or 255.255.255.255!

Never set all bits to equal 0 or 1 in one byte (byte = 0 or 255). These are reserved for special functions and may not be allocated. Therefore, the address 10.0.10.10 may not be used due to the 0 in the second byte.

If a network is to be directly connected to the Internet, only registered, internationally unique IP addresses allocated by a central registration service may be used. These are available from Inter*NIC* (International Network Information Center).

## Note

### Internet access only by the authorized network administrator!

Direct connection to the Internet should only be performed by an authorized network administrator and is therefore not described in this manual.

#### **Subnets**

To allow routing within large networks a convention was introduced in the specification RFC 950. Part of the Internet address, the subscriber ID is divided up again into a subnetwork number and the station number of the node. With the aid of the network number it is possible to branch into internal subnetworks within the partial network, but the entire network is physically connected together. The size and position of the subnetwork ID are not defined; however, the size is dependent upon the number of subnets to be addressed and the number of subscribers per subnet.

Table 54: Example: Class B Address with Field for Subnet IDs

| 1   | 8              | 16        | 24  | 32   |
|-----|----------------|-----------|-----|------|
| 1 ( | <br>Network ID | Subnet ID | Hos | t ID |

#### **Subnet Mask**

A subnet mask was introduced to encode the subnets in the Internet. This involves a bit mask, which is used to mask out or select specific bits of the IP address. The mask defines the subscriber ID bits used for subnet coding, which denote the ID of the subscriber. The entire IP address range theoretically lies between 0.0.0.0 and 255.255.255.255. Each 0 and 255 from the IP address range are reserved for the subnet mask.

The standard masks depending upon the respective network class are as follows:

#### Class A Subnet mask:

Table 55: Subnet Mask for Class A Network

| <br>Two to the sweller frame for class first out on |    |    |    |
|---|----|----|----|
| 255   | .0 | .0 | .0 |

#### • Class B Subnet mask:

Table 56: Subnet Mask for Class B Network

| 255 | .255 | .0 | .0 |
|-----|------|----|----|
|-----|------|----|----|

#### Class C Subnet mask:

Table 57: Subnet Mask for Class C Network

| Table 57. Subilet Wask for Class C Network |      |      |    |  |  |
|--|------|------|----|--|--|
| 255  | .255 | .255 | .0 |  |  |

Depending on the subnet division the subnet masks may, however, contain other values beyond 0 and 255, such as 255.255.255.128 or 255.255.255.248.

Your network administrator allocates the subnet mask number to you.

Together with the IP address, this number determines which network your PC and your node belongs to.

The recipient node, which is located on a subnet, initially calculates the correct network number from its own IP address and subnet mask. Only then the node checks the node number and, if it corresponds, delivers the entire packet frame.

Table 58: Example for an IP Address from a Class B Network

| IP address  | 172.16.233.200  | '10101100 00010000 11101001 11001000' |
|-------------|-----------------|---------------------------------------|
| Subnet mask | 255.255.255.128 | '11111111 11111111 11111111 10000000' |
| Net ID      | 172.16.0.0      | '10101100 00010000 00000000 00000000' |
| Subnet ID   | 0.0.233.128     | '00000000 00000000 11101001 10000000' |
| Host ID     | 0.0.0.72        | '00000000 00000000 00000000 01001000' |

## Note

### Specification of the network mask necessary!

Specify the network mask defined by the administrator in the same way as the IP address when installing the network protocol.

### Gateway

The subnets of the Internet are normally connected via gateways. The function of these gateways is to forward packets to other networks or subnets.

This means that in addition to the IP address and network mask for each network card, it is necessary to specify the correct IP address of the standard gateway for a PC or fieldbus node connected to the Internet. You should also be able to obtain this IP address from your network administrator.

The IP function is limited to the local subnet if this address is not specified.

To communicate directly with each other, host and gateway must be on the same subnet, that means the network ID must be the same.

#### **RAW IP**

Raw IP manages without protocols such as PPP (point-to-point protocol). With RAW IP, the TCP/IP packets are directly exchanged without handshaking, thus enabling the connection to be established more quickly.

However, the connection must beforehand have been configured with a fixed IP address. The advantages of RAW IP are high data transfer rate and good stability.

#### **IP Multicast**

Multicast refers to a method of transmission from a point to a group, which is a point-to-multipoint transfer or multipoint connection. The advantage of multicast is that messages are simultaneously transferred to several users or closed user groups via one address.

IP multicasting at the Internet level is realized with the help of the Internet Group Message Protocol IGMP; neighboring routers use this protocol to inform each other on membership to the group.

For distribution of multicast packets in the sub-network, IP assumes that the datalink layer supports multicasting. In the case of Ethernet, you can provide a packet with a multicast address in order to send the packet to several recipients with a single send operation. Here, the common medium enables packets to be sent simultaneously to several recipients. The stations do not have to inform each other on who belongs to a specific multicast address – every station physically receives every packet. The resolution of IP address to Ethernet address is solved

by the use of algorithms, IP multicast addresses are embedded in Ethernet multicast addresses.

### 11.1.1.2 TCP (Transmission Control Protocol)

As the layer above the Internet protocol, TCP (Transmission Control Protocol) guarantees the secure transport of data through the network.

TCP enables two subscribers to establish a connection for the duration of the data transmission. Communication takes place in full-duplex mode (i.e., transmission between two subscribers in both directions simultaneously).

TCP provides the transmitted message with a 16-bit checksum and each data packet with a sequence number.

The receiver checks that the packet has been correctly received on the basis of the checksum and then sets off the sequence number. The result is known as the acknowledgement number and is returned with the next self-sent packet as an acknowledgement.

This ensures that the lost TCP packets are detected and resent, if necessary, in the correct sequence.

#### **TCP Data Packet**

The packet header of a TCP data packet is comprised of at least 20 bytes and contains, among others, the application port number of the transmitter and the receiver, the sequence number and the acknowledgement number.

The resulting TCP packet is used in the data unit area of an IP packet to create a TCP/IP packet.

#### TCP Port Numbers

TCP can, in addition to the IP address (network and subscriber address), respond to a specific application (service) on the addressed subscriber. For this the applications located on a subscriber, such as a web server, FTP server and others are addressed via different port numbers. Well-known applications are assigned fixed ports to which each application can refer when a connection is built up (Examples: Telnet Port number: 23, http Port number: 80).

A complete list of "standardized services" is contained in the RFC 1700 (1994) specifications.

#### 11.1.1.3 **UDP (User Datagram Protocol)**

The UDP protocol, like the TCP protocol, is responsible for the transport of data. Unlike the TCP protocol, UDP is not connection-orientated; meaning that there are no control mechanisms for the data exchange between transmitter and receiver. The advantage of this protocol is the efficiency of the transmitted data and the resulting higher processing speed.

#### **Configuration and Diagnostics Protocols** 11.1.2

#### 11.1.2.1 **BootP (Bootstrap Protocol)**

The "Bootstrap Protocol" (BootP) can be used to assign an IP address and other parameters to the fieldbus coupler/controller in a TCP/IP network. Subnet masks and gateways can also be transferred using this protocol. Protocol communication is comprised of a client request from the fieldbus coupler or controller and a server response from the PC.

A broadcast request is transmitted to Port 67 (BootP server) via the protocol that contains the hardware address (MAC ID) for the fieldbus coupler or controller.

The BootP server then receives this message. The server contains a database in which the MAC ID and IP addresses are assigned to one another. When a MAC address is found a broadcast reply is transmitted via the network.

The fieldbus coupler/controller "listens" at the specified Port 68 for a response from the BootP server. Incoming packets contain information such as the IP address and the MAC address for the fieldbus coupler/controller. A fieldbus coupler/controller recognizes by the MAC address that the message is intended for that particular fieldbus coupler/controller and accepts the transmitted IP address into its network.

### Note

### IP addresses can be assigned via BootP under Windows and Linux!

You can use WAGO-BootP-Server to assign an IP address under the Windows and Linux operating systems. You can also use any other BootP server besides WAGO-BootP-Server. You can also use any other BootP server besides the WAGO-BootP-Server.

# Information

#### More information about WAGO-BootP-Server

The process for assigning addresses using WAGO-BootP-Server is described in detail in the section "Commissioning".

The BootP Client assists in the dynamic configuration of the network parameters: The ETHERNET TCP/IP fieldbus controller has a BootP client that supports the following options in addition to the default "IP address" option:

Table 59: BootP Options

| Option              | Meaning  |
|---------------------|--|
| [OPT1] Subnet mask  | 32-bit address mask that displays which bits of the IP address identify the network and which identify the network stations. |
| [OPT2] Time zone    | Time difference between the local time and the UTC (Universal Time Coordinated).   |
| [OPT3] Gateway      | IP address of the router that permits access to other networks.  |
| [OPT6] DNS server   | IP address of the name servers that converts a name into an IP address. Up to 2 DNS servers can be configured.               |
| [OPT12] Host name   | The name of the host is the unique name of a computer in a network. The host name can contain up to 32 characters.           |
| [OPT15] Domain name | The name of the domain is the unique name of a network. The domain name can contain up to 32 characters.                     |
| [OPT42] NTP-Server  | Option not supported.  |

The "Features" WBM page can also be used to select the "BootP Request before static IP" option. After the restart, 5 BootP queries are sent. If there is no response to any of these queries, the fieldbus coupler/controller tries to configure itself with the IP parameters saved in the EEPROM.

If you want the IP address and subnet mask are stored in the EEPROM when using the Bootstrap protocol, then the option "use IP from EEPROM" has to be switched (via the WBM, HTML page "Port") following the configuration via BootP.

When booting next the fieldbus coupler/controller uses the parameters saved in the EEPROM.

By default, BootP is activated in the fieldbus coupler/controller.

When BootP is activated, the fieldbus coupler/controller expects the BootP server to be permanently available.

If there is no BootP server available after a PowerOn reset, the network will remain inactive.

If there is an error in the saved parameters, the I/O LED reports a blink code and configuration via BootP is turned on automatically.

#### 11.1.2.2 **DHCP (Dynamic Host Configuration Protocol)**

The fieldbus coupler/controller internal HTML page opened via the "Port" link provides the option to configure the network using the data saved in the EEPROM or via DHCP instead of via the BootP protocol.

DHCP (Dynamic Host Configuration Protocol) is a further development of BootP and is backwards compatible with BootP.

Both BOOTP and DHCP assign an IP address to the fieldbus node (Client) when starting; the sequence is the same as for BootP.

For configuration of the network parameters via DHCP, the fieldbus coupler/controller sends a client request to the DHCP server e.g., on the connected PC.

A broadcast request is transmitted to Port 67 (DHCP server) via the protocol that contains the hardware address (MAC ID) for the fieldbus coupler/controller.

The DHCP server then receives this message. The server contains a database in which the MAC ID and IP addresses are assigned to one another. When a MAC address is found a broadcast reply is transmitted via the network.

The fieldbus coupler/controller "listens" at the specified Port 68 for a response from the DHCP server. Incoming packets contain information such as the IP address and the MAC address for the fieldbus coupler/controller. A fieldbus coupler/controller recognizes by the MAC address that the message is intended for that particular fieldbus coupler/controller and accepts the transmitted IP address into its network.

If there is no reply, the inquiry is sent again after 4 seconds, 8 seconds and 16

If all inquiries receive no reply, a blink code is reported via the I/O LED.

If you want the IP address and subnet mask are stored in the EEPROM when using DHCP, then the option "use IP from EEPROM" has to be switched (via the WBM, HTML page "Port") following the configuration via DHCP. When booting next the fieldbus coupler/controller uses the parameters saved in the EEPROM.

The difference between BOOTP and DHCP is that both use different assignment methods and that configuration with DHCP is time limited. The DHCP client always has to update the configuration after the time has elapsed. Normally, the same parameters are continuously confirmed by the server.

BOOTP can be used to assign a fixed IP address for each client where the addresses and their reservation are permanently saved in the BOOTP server database.

Because of this time dependency, DHCP is also used to dynamically assign available IP addresses through client leases (lease time after which the client requests a new address) where each DHCP client address is saved temporarily in the server database

In addition, DHCP clients do not require a system restart to rebind or renew configuration with the DHCP server. Instead, clients automatically enter a rebinding state at set timed intervals to renew their leased address allocation with the DHCP server. This process occurs in the background and is transparent to the

There are three different operating modes for a DHCP server:

#### Manual assignment

In this mode, the IP addresses are permanently assigned on the DHCP server to specific MAC addresses. The addresses are assigned to the MAC address for an indefinite period.

Manual assignments are used primarily to ensure that the DHCP client can be reached under a fixed IP address.

### **Automatic assignment**

For automatic assignment, a range of IP addresses is assigned on the DHCP

server.

If the address was assigned from this range once to a DHCP client, then it belongs to the client for an indefinite period as the assigned IP address is also bound to the MAC address.

#### **Dynamic assignment**

This process is similar to automatic assignment, but the DHCP server has a statement in its configuration file that specifies how long a certain IP address may be "leased" to a client before the client must log into the server again and request an "extension".

If the client does not log in, the address is released and can be reassigned to another (or the same) client. The time defined by the administrator is called Lease Time.

Some DHCP servers also assign IP addresses based on the MAC address, i.e., a client receives the same IP address as before after longer network absence and elapse of the Lease Time (unless the IP address has been assigned otherwise in the mean time).

DHCP is used to dynamically configure the network parameters. The ETHERNET TCP/IP fieldbus controller has a DHCP client that supports the following options in addition to the default "IP address" option:

Table 60: Meaning of DHCP Options

| Option                 | Meaning   |  |  |  |  |
|------------------------|---|--|--|--|--|
| [OPT1] Subnet mask     | 32-bit address mask that displays which bits of the IP address identify the network and which identify the network stations.  |  |  |  |  |
| [OPT2] Time zone       | Time difference between the local time and the UTC (Universal Time Coordinated).  |  |  |  |  |
| [OPT3] Gateway         | IP address of the router that permits access to other networks.   |  |  |  |  |
| [OPT6] DNS server      | IP address of the name servers that converts a name into an IP address. Up to 2 DNS servers can be configured.  |  |  |  |  |
| [OPT15] Domain name *) | The name of the domain is the unique name of a network. The domain name can contain up to 32 characters.  |  |  |  |  |
| [OPT42] NTP server     | IP address of the Network Time Server. When assigning an NTP server, the SNTP client is automatically enabled in the coupler.   |  |  |  |  |
| [OPT51] Lease time     | The maximum duration (i.e., how long the fieldbus coupler/controller maintains the assigned IP address) can be defined here. The maximum lease time for the fieldbus controller is 48 days. This is due to the internal timer resolution. |  |  |  |  |
| [OPT58] Renewing time  | The renewing time indicates when the fieldbus coupler/controller must renew the lease time. The renewing time should be approximately half of the lease time.   |  |  |  |  |
| [OPT59] Rebinding time | The rebinding time indicates after what amount of time the fieldbus coupler/controller must have received its new address. The rebinding time should be approximately 7/8 of the lease time.  |  |  |  |  |

<sup>\*)</sup> In contrast to BootP, the DHCP client does not support assignment of the host name.

#### 11.1.2.3 **HTTP (Hypertext Transfer Protocol)**

HTTP is a protocol used by WWW (World Wide Web) servers for the forwarding of hypermedia, texts, images, audiodata, etc.

Today, HTTP forms the basis of the Internet and is also based on requests and responses in the same way as the BootP protocol.

The HTTP server implemented in the (programmable) fieldbus coupler or controller is used for viewing the HTML pages saved in the coupler/controller. The HTML pages provide information about the coupler/controller (state, configuration), the network and the process image.

On some HTML pages, (programmable) fieldbus coupler or controller settings can also be defined and altered via the web-based management system (e.g. whether IP configuration of the coupler/controller is to be performed via the DHCP protocol, the BootP protocol or from the data stored in the EEPROM).

The HTTP server uses port number 80.

#### 11.1.2.4 **DNS (Domain Name Systems)**

The DNS client enables conversion of logical Internet names such as www.wago.com into the appropriate decimal IP address represented with separator stops, via a DNS server. Reverse conversion is also possible.

The addresses of the DNS server are configured via DHCP, BootP or web-based management. Up to 2 DNS servers can be specified. The host identification can be achieved with two functions; an internal host table is not supported.

#### **FTP-Server (File Transfer Protocol)** 11.1.2.5

The file transfer protocol (FTP) enables files to be exchanged between different network stations regardless of operating system.

In the case of the ETHERNET coupler/controller, FTP is used to store and read the HTML pages created by the user, the IEC61131 program and the IEC61131 source code in the (programmable) fieldbus coupler or controller.

A total memory of 2 MB is available for the file system.

#### Cycles for flash limited to 1 million!

Up to 1 million write cycles per sector are allowed when writing the flash for the file system. The file system supports "Wear-Leveling", so that the same sectors are not always written to.

# Information

#### More Information about the implemented Protocols

You can find a list of the exact available implemented protocols in the section "Technical Data" to the fieldbus coupler and/or controller.

#### **SNMP (Simple Network Management Protocol)** 11.1.2.6

The Simple Network Management Protocol (SNMP) is responsible for transporting the control data that allows the exchange of management information as well as status and statistic data between individual network components and a management system.

An SNMP management workstation polls the SNMP agents to obtain information on the relevant devices.

SNMP is supported in versions 1/2c and some fieldbus couplers/controllers in version 3.

This represents a community message exchange in SNMP versions 1 and 2c. The community name of the network community must thereby be specified.

In SNMP version 3, exchanging messages is user-related. Each device, that knows the passwords set via WBM, may read or write values from the controller. In SNMPv3, user data from SNMP messages can also be transmitted in encoded form. This way, both requested values and values to be written cannot be easily decoded by others via ETHERNET. This is why SNMPv3 is often used in safetyrelated networks.

The device data, that can be accessed or modified by an SNMP agent, is called SNMP object. The sets of SNMP objects are stored in a logical database called Management Information Base (MIB); this is why these objects are typically known as "MIB objects".

The SNMP of the ETHERNET controller includes both the general MIB acc. to RFC1213 (MIB II) and a special WAGO MIB.

SNMP is processed via port 161. The port number for SNMP traps (agent messages) is 161. Both ports must be enabled to use SNMP.

#### 11.1.2.6.1 MIB II Description

MIB II acc. to RFC1213 is divided into the following groups:

Table 61: MIB II groups

| acte of this it groups |                  |  |  |  |
|------------------------|------------------|--|--|--|
| Group                  | Identifier       |  |  |  |
| System Group           | 1.3.6.1.2.1.1    |  |  |  |
| Interface Group        | 1.3.6.1.2.1.2    |  |  |  |
| IP Group               | 1.3.6.1.2.1.4    |  |  |  |
| IpRoute Table Group    | 1.3.6.1.2.1.4.21 |  |  |  |
| ICMP Group             | 1.3.6.1.2.1.5    |  |  |  |
| TCP Group              | 1.3.6.1.2.1.6    |  |  |  |
| UDP Group              | 1.3.6.1.2.1.7    |  |  |  |
| SNMP Group             | 1.3.6.1.2.1.11   |  |  |  |

#### 11.1.2.6.2 Traps

#### **Standard Traps**

For specific events, the SNMP agent will independently send one of the following messages without polling the manager.

# Note

#### Enable event messages (traps) in the WBM!

Initially enable the event messages in the WBM in menu "SNMP" under "Trap Enable". Traps in version 1, 2c and 3 may be activated separately.

The following messages are triggered automatically as traps (SNMPv1) by the fieldbus coupler/controller:

Table 62: Standard Trans

| TrapType/TrapNumber/<br>OID of the provided value        | Name                  | Event   |  |
|--|-----------------------|---|--|
| TrapType = 0   | ColdStart             | Restart the coupler/controller  |  |
| TrapType = 1   | WarmStart             | Reset via service switch  |  |
| TrapType = 3   | EthernetUp            | Network connection detected   |  |
| TrapType = 4   | AuthenticationFailure | Unauthorized (abortive) MIB access  |  |
| TrapType = 6/<br>ab Trap-Nummer 25<br>benutzerspezifisch | enterpriseSpecific    | Enterprise-specific messages and function poll in the PFC program starting with enterprise trap number 25 |  |

# 11.1.3 Application Protocols

If fieldbus specific application protocols are implemented, then the appropriate fieldbus specific communication is possible with the respective coupler/controller. Thus the user is able to have a simple access from the respective fieldbus on the fieldbus node.

The implemented fieldbus specific application protocols these protocols are individual described in the following chapters.

#### 11.2 **MODBUS Functions**

#### 11.2.1 General

MODBUS is a manufacturer-independent, open fieldbus standard for diverse applications in manufacturing and process automation.

The MODBUS protocol is implemented according to the current Internet Draft of the IETF (Internet Engineering Task Force) and performs the following functions:

- Transmission of the process image
- Transmission of the fieldbus variables
- Transmission of different settings and information on the coupler/controller

The data transmission in the fieldside takes place via TCP and via UDP.

The MODBUS/TCP protocol is a variation of the MODBUS protocol, which was optimized for communication via TCP/IP connections.

This protocol was designed for data exchange in the field level (i.e. for the exchange of I/O data in the process image).

All data packets are sent via a TCP connection with the port number 502.

#### **MODBUS/TCP** segment

The general MODBUS/TCP header is as follows:

Table 63: MODBUS/TCP Header

| Byte | 0      | 1      | 2       | 3       | 4       | 5        | 6               | 7        | 8 n  |
|------|--------|--------|---------|---------|---------|----------|-----------------|----------|------|
|      | Iden   | tifier | Prot    | tocol-  | Lengt   | h field  | Unit identifier | MODBUS   | Data |
|      | (enter | ed by  | ider    | ntifier | (High b | yte, low | (Slave          | function |      |
|      | rece   | iver)  | (is alv | ways 0) | by      | te)      | address)        | code     |      |

# Information

#### **Additional Information**

The structure of a datagram is specific for the individual function. Refer to the descriptions of the MODBUS Function codes.

For the MODBUS protocol 15 connections are made available over TCP. Thus it allows digital and analog output data to be directly read out at a fieldbus node and special functions to be executed by way of simple MODBUS function codes from 15 stations simultaneously.

For this purpose a set of MODBUS functions from the Open MODBUS/TCP specification is realized.

# Information

#### More information

More information on the "Open MODBUS/TCP specification" you can find in the Internet: www.modbus.org.

Therefore the MODBUS protocol based essentially on the following basic data types:

Table 64: Basic Data Types of MODBUS Protocol

| Data type        | Length  | Description        |
|------------------|---------|--------------------|
| Discrete inputs  | 1 bit   | Digital inputs     |
| Coils            | 1 bit   | Digital outputs    |
| Input register   | 16 bits | Analog input data  |
| Holding register | 16 bits | Analog output data |

For each basic data type one or more function codes are defined.

These functions allow digital or analog input and output data, and internal variables to be set or directly read out of the fieldbus node.

Table 65: List of the MODBUS Functions in the Fieldbus Coupler

| <b>Function code</b> |      | Function                            | Access method and description                                    | Acce | ss to resources                   |
|----------------------|------|-------------------------------------|--|------|-----------------------------------|
| FC1                  | 0x01 | Read Coils                          | Reading of several single input bits                             | R:   | Process image                     |
| FC2                  | 0x02 | Read Discrete<br>Inputs             | Reading of several input bits                                    | R:   | Process image                     |
| FC3                  | 0x03 | Read Holding<br>Registers           | Reading of several input registers                               | R:   | Process image, internal variables |
| FC4                  | 0x04 | Read Input<br>Registers             | Reading of several input registers                               | R:   | Process image, internal variables |
| FC5                  | 0x05 | Write Single<br>Coil                | Writing of an individual output bit                              | W:   | Process image                     |
| FC6                  | 0x06 | Write Single<br>Register            | Writing of an individual output register                         | W:   | Process image, internal variables |
| FC11                 | 0x0B | Get Comm<br>Event Counters          | Communication event counter                                      | R:   | None                              |
| FC15                 | 0x0F | Write Multiple<br>Coils             | Writing of several output bits                                   | W:   | Process image                     |
| FC16                 | 0x10 | Write Multiple<br>Registers         | Writing of several output registers                              | W:   | Process image, internal variables |
| FC22                 | 0x16 | Mask Write<br>Register              | Writing of several bits of an individual output register by mask | W:   | Process image                     |
| FC23                 | 0x17 | Read/Write<br>Multiple<br>Registers | Reading and writing of several output registers                  | R/W  | : Process image                   |

To execute a desired function, specify the respective function code and the address of the selected input or output data.

# Note

## Note the number system when addressing!

The examples listed use the hexadecimal system (i.e.: 0x000) as their numerical format. Addressing begins with 0. The format and beginning of the addressing may vary according to the software and the control system. All addresses then need to be converted accordingly.

#### 11.2.2 Use of the MODBUS Functions

The example below uses a graphical view of a fieldbus node to show which MODBUS functions can be used to access data of the process image.

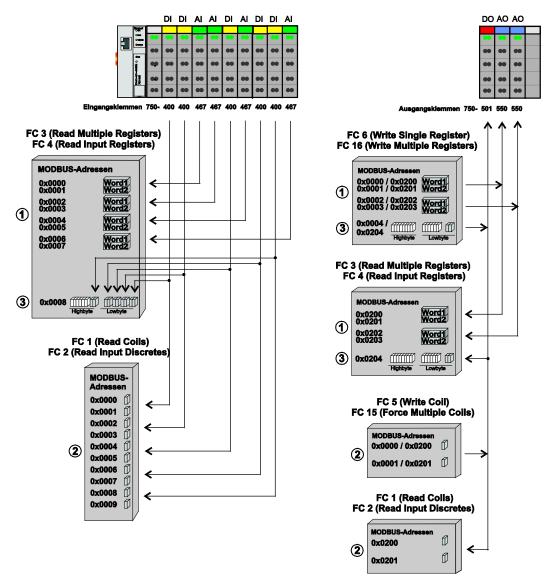

Figure 56: Use of the MODBUS Functions

# Note

# Use register functions to access analog signals and coil functions to access binary signals!

It is recommended that analog data be accessed with register functions ① and digital data with coil functions ②. If reading or writing access to binary signals is performed via register functions ③, an address shift may occur as soon as further analog modules are operated on the coupler/controller.

# 11.2.3 Description of the MODBUS Functions

All MODBUS functions are executed as follows:

- 1. A MODBUS TCP master (e.g., a PC) makes a request to the WAGO fieldbus node using a specific function code based on the desired operation..
- 2. The WAGO fieldbus node receives the datagram and then responds to the master with the proper data, which is based on the master's request.

If the WAGO fieldbus node receives an incorrect request, it sends an error datagram (Exception) to the master.

The exception code contained in the exception has the following meaning:

Table 66: Exception Codes

| <b>Exception code</b> | Meaning                                 |
|-----------------------|---|
| 0x01                  | Illegal function                        |
| 0x02                  | Illegal data address                    |
| 0x03                  | Illegal data value                      |
| 0x04                  | Slave device failure                    |
| 0x05                  | Acknowledge                             |
| 0x06                  | Server busy                             |
| 0x08                  | Memory parity error                     |
| 0x0A                  | Gateway path unavailable                |
| 0x0B                  | Gateway target device failed to respond |

The following chapters describe the datagram architecture of request, response and exception with examples for each function code.

# Note

# Reading and writing of outputs via FC1 to FC4 is also possible by adding an offset!

In the case of the read functions (FC1 ... FC4) the outputs can be additionally written and read back by adding an offset of 200hex (0x0200) to the MODBUS addresses in the range of [ $0_{hex}$  ... FF<sub>hex</sub>] and an offset of  $1000_{hex}$  (0x01000) to the MODBUS addresses in the range of [ $6000_{hex}$  ...  $62FC_{hex}$ ].

#### 11.2.3.1 Function Code FC1 (Read Coils)

This function reads the status of the input and output bits (coils) in a slave device.

#### Request

The request specifies the reference number (starting address) and the bit count to read.

Example: Read output bits 0 to 7.

Table 67: Request of Function Code FC1

| Byte        | Field name             | Example       |
|-------------|------------------------|---------------|
| Byte 0, 1   | Transaction identifier | 0x0000        |
| Byte 2, 3   | Protocol identifier    | 0x0000        |
| Byte 4, 5   | Length field           | 0x0006        |
| Byte 6      | Unit identifier        | 0x01 not used |
| Byte 7      | MODBUS function code   | 0x01          |
| Byte 8, 9   | Reference number       | 0x0000        |
| Byte 10, 11 | Bit count              | 0x0008        |

#### Response

The current values of the response bits are packed in the data field. A binary 1 corresponds to the ON status and a 0 to the OFF status. The lowest value bit of the first data byte contains the first bit of the request. The others follow in ascending order. If the number of inputs is not a multiple of 8, the remaining bits of the last data byte are filled with zeroes (truncated).

Table 68: Response of Function Code FC1

| Byte   | Field name           | Example |
|--------|----------------------|---------|
|        |                      |         |
| Byte 7 | MODBUS function code | 0x01    |
| Byte 8 | Byte count           | 0x01    |
| Byte 9 | Bit values           | 0x12    |

The status of the inputs 7 to 0 is shown as byte value 0x12 or binary 0001 0010. Input 7 is the bit having the highest significance of this byte and input 0 the lowest

value.

The assignment is thus made from 7 to 0 as follows:

Table 69: Assignment of Inputs

|      | OFF | OFF | OFF | ON | OFF | OFF | ON | OFF |
|------|-----|-----|-----|----|-----|-----|----|-----|
| Bit  | 0   | 0   | 0   | 1  | 0   | 0   | 1  | 0   |
| Coil | 7   | 6   | 5   | 4  | 3   | 2   | 1  | 0   |

## **Exception**

Table 70: Exception of Function Code FC1

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x81         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

#### 11.2.3.2 Function Code FC2 (Read Discrete Inputs)

This function reads the input bits from a slave device.

#### Request

The request specifies the reference number (starting address) and the bit count to be read

Example: Read input bits 0 to 7

Table 71: Request of Function Code FC2

| Byte        | Field name             | Example       |
|-------------|------------------------|---------------|
| Byte 0, 1   | Transaction identifier | 0x0000        |
| Byte 2, 3   | Protocol identifier    | 0x0000        |
| Byte 4, 5   | Length field           | 0x0006        |
| Byte 6      | Unit identifier        | 0x01 not used |
| Byte 7      | MODBUS function code   | 0x02          |
| Byte 8, 9   | Reference number       | 0x0000        |
| Byte 10, 11 | Bit count              | 0x0008        |

#### Response

The current value of the requested bits are packed into the data field. A binary 1 corresponds to the ON status and a 0 the OFF status. The lowest value bit of the first data byte contains the first bit of the inquiry. The others follow in an ascending order. If the number of inputs is not a multiple of 8, the remaining bits of the last data byte are filled with zeroes (truncated).

Table 72: Response of Function Code FC2

| Byte   | Field name           | Example |
|--------|----------------------|---------|
|        |                      |         |
| Byte 7 | MODBUS function code | 0x02    |
| Byte 8 | Byte count           | 0x01    |
| Byte 9 | Bit values           | 0x12    |

The status of the inputs 7 to 0 is shown as a byte value 0x12 or binary 0001 0010. Input 7 is the bit having the highest significance of this byte and input 0 the lowest value. The assignment is thus made from 7 to 0 as follows:

Table 73: Assignment of Inputs

|      | OFF | OFF | OFF | ON |
|------|-----|-----|-----|----|
| Bit  | 0   | 0   | 0   | 1  |
| Coil | 7   | 6   | 5   | 4  |

| OFF | OFF | ON | OFF |
|-----|-----|----|-----|
| 0   | 0   | 1  | 0   |
| 3   | 2   | 1  | 0   |

Table 74: Exception of Function Code FC2

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x82         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

#### 11.2.3.3 Function Code FC3 (Read Multiple Registers)

This function reads the contents of holding registers from a slave device in word format.

#### Request

The request specifies the reference number (start register) and the word count (register quantity) of the registers to be read. The reference number of the request is zero based, therefore, the first register starts at address 0. Example: Read registers 0 and 1.

Table 75: Request of Function Code FC3

| Byte        | Field name             | Example       |
|-------------|------------------------|---------------|
| Byte 0, 1   | Transaction identifier | 0x0000        |
| Byte 2, 3   | Protocol identifier    | 0x0000        |
| Byte 4, 5   | Length field           | 0x0006        |
| Byte 6      | Unit identifier        | 0x01 not used |
| Byte 7      | MODBUS function code   | 0x03          |
| Byte 8, 9   | Reference number       | 0x0000        |
| Byte 10, 11 | Word count             | 0x0002        |

#### Response

The reply register data is packed as 2 bytes per register. The first byte contains the higher value bits, the second the lower values.

Table 76: Response of Function Code FC3

| Byte        | Field name           | Example |
|-------------|----------------------|---------|
|             |                      |         |
| Byte 7      | MODBUS function code | 0x03    |
| Byte 8      | Byte count           | 0x04    |
| Byte 9, 10  | Value register 0     | 0x1234  |
| Byte 11, 12 | Value register 1     | 0x2345  |

The contents of register 0 are displayed by the value 0x1234 and the contents of register 1 is 0x2345.

Table 77: Exception of Function Code FC3

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x83         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

### 11.2.3.4 Function Code FC4 (Read Input Registers)

This function reads contents of input registers from the slave device in word format.

#### Request

The request specifies a reference number (start register) and the word count (register quantity) of the registers to be read. The reference number of the request is zero based, therefore, the first register starts at address 0.

Example: Read registers 0 and 1

Table 78: Request of Function Code FC4

| Byte        | Field name             | Example       |
|-------------|------------------------|---------------|
| Byte 0, 1   | Transaction identifier | 0x0000        |
| Byte 2, 3   | Protocol identifier    | 0x0000        |
| Byte 4, 5   | Length field           | 0x0006        |
| Byte 6      | Unit identifier        | 0x01 not used |
| Byte 7      | MODBUS function code   | 0x04          |
| Byte 8, 9   | Reference number       | 0x0000        |
| Byte 10, 11 | Word count             | 0x0002        |

#### Response

The register data of the response is packed as 2 bytes per register. The first byte has the higher value bits, the second the lower values.

Table 79: Response of Function Code FC4

| Byte        | Field name           | Example |
|-------------|----------------------|---------|
|             |                      |         |
| Byte 7      | MODBUS function code | 0x04    |
| Byte 8      | Byte count           | 0x04    |
| Byte 9, 10  | Value register 0     | 0x1234  |
| Byte 11, 12 | Value register 1     | 0x2345  |

The contents of register 0 are shown by the value 0x1234 and the contents of register 1 is 0x2345.

Table 80: Exception of Function Code FC4

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x84         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

#### 11.2.3.5 **Function Code FC5 (Write Coil)**

This function writes a single output bit to the slave device.

#### Request

The request specifies the reference number (output address) of output bit to be written. The reference number of the request is zero based; therefore, the first coil starts at address 0.

Example: Turn ON the second output bit (address 1)

Table 81: Request of Function Code FC5

| Byte      | Field name             | Example       |
|-----------|------------------------|---------------|
| Byte 0, 1 | Transaction identifier | 0x0000        |
| Byte 2, 3 | Protocol identifier    | 0x0000        |
| Byte 4, 5 | Length field           | 0x0006        |
| Byte 6    | Unit identifier        | 0x01 not used |
| Byte 7    | MODBUS function code   | 0x05          |
| Byte 8, 9 | Reference number       | 0x0001        |
| Byte 10   | ON/OFF                 | 0xFF          |
| Byte 11   |                        | 0x00          |

#### Response

Table 82: Response of Function Code FC5

| Byte      | Field name           | Example |
|-----------|----------------------|---------|
|           |                      |         |
| Byte 7    | MODBUS function code | 0x05    |
| Byte 8, 9 | Reference number     | 0x0001  |
| Byte 10   | Value                | 0xFF    |
| Byte 11   |                      | 0x00    |

Table 83: Exception of Function Code FC5

| Byte   | Field name           | Example            |
|--------|----------------------|--------------------|
|        |                      |                    |
| Byte 7 | MODBUS function code | 0x85               |
| Byte 8 | Exception code       | 0x01, 0x02 or 0x03 |

#### 11.2.3.6 Function Code FC6 (Write Single Register)

This function writes the value of one single output register to a slave device in word format.

#### Request

The request specifies the reference number (register address) of the first output word to be written. The value to be written is specified in the "Register Value" field. The reference number of the request is zero based; therefore, the first register starts at address 0.

Example: Write a value of 0x1234 to the second output register

Table 84: Request of Function Code FC6

| Byte        | Field name             | Example       |
|-------------|------------------------|---------------|
| Byte 0, 1   | Transaction identifier | 0x0000        |
| Byte 2, 3   | Protocol identifier    | 0x0000        |
| Byte 4, 5   | Length field           | 0x0006        |
| Byte 6      | Unit identifier        | 0x01 not used |
| Byte 7      | MODBUS function code   | 0x06          |
| Byte 8, 9   | Reference number       | 0x0001        |
| Byte 10, 11 | Register value         | 0x1234        |

#### Response

The reply is an echo of the inquiry.

Table 85: Response of Function Code FC6

| Byte        | Field name           | Example |
|-------------|----------------------|---------|
|             |                      |         |
| Byte 7      | MODBUS function code | 0x06    |
| Byte 8, 9   | Reference number     | 0x0001  |
| Byte 10, 11 | Register value       | 0x1234  |

Table 86: Exception of Function Code FC6

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x85         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

#### 11.2.3.7 Function Code FC11 (Get Comm Event Counter)

This function returns a status word and an event counter from the slave device's communication event counter. By reading the current count before and after a series of messages, a master can determine whether the messages were handled normally by the slave.

Following each successful new processing, the counter counts up. This counting process is not performed in the case of exception replies, poll commands or counter inquiries.

### Request

Table 87: Request of Function code FC11

| Byte      | Field name             | Example       |
|-----------|------------------------|---------------|
| Byte 0, 1 | Transaction identifier | 0x0000        |
| Byte 2, 3 | Protocol identifier    | 0x0000        |
| Byte 4, 5 | Length field           | 0x0002        |
| Byte 6    | Unit identifier        | 0x01 not used |
| Byte 7    | MODBUS function code   | 0x0B          |

#### Response

The reply contains a 2-byte status word and a 2-byte event counter. The status word only contains zeroes.

Table 88: Response of Function Code FC11

| Byte        | Field name           | Example |
|-------------|----------------------|---------|
|             |                      |         |
| Byte 7      | MODBUS function code | 0x0B    |
| Byte 8, 9   | Status               | 0x0000  |
| Byte 10, 11 | Event count          | 0x0003  |

The event counter shows that 3(0x0003) events were counted.

Table 89: Exception of Function Code FC 11

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x85         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

#### 11.2.3.8 Function Code FC15 (Write Multiple Coils)

This function sets a sequence of output bits to 1 or 0 in a slave device. The maximum number is 256 bits.

#### Request

The request message specifies the reference number (first coil in the sequence), the bit count (number of bits to be written), and the output data. The output coils are zero-based; therefore, the first output point is 0.

In this example 16 bits are set, starting with the address 0. The request contains 2 bytes with the value 0xA5F0, or 1010 0101 1111 0000 in binary format.

The first data byte transmits the value of 0xA5 to the addresses 7 to 0, whereby 0 is the lowest value bit. The next byte transmits 0xF0 to the addresses 15 to 8, whereby the lowest value bit is 8.

Table 90: Request of Function Code FC15

| Byte        | Field name             | Example       |
|-------------|------------------------|---------------|
| Byte 0, 1   | Transaction identifier | 0x0000        |
| Byte 2, 3   | Protocol identifier    | 0x0000        |
| Byte 4, 5   | Length field           | 0x0009        |
| Byte 6      | Unit identifier        | 0x01 not used |
| Byte 7      | MODBUS function code   | 0x0F          |
| Byte 8, 9   | Reference number       | 0x0000        |
| Byte 10, 11 | Bit count              | 0x0010        |
| Byte 12     | Byte count             | 0x02          |
| Byte 13     | Data byte1             | 0xA5          |
| Byte 14     | Data byte2             | 0xF0          |

#### Response

Table 91: Response of Function Code FC15

| Byte        | Field name           | Example |
|-------------|----------------------|---------|
|             |                      |         |
| Byte 7      | MODBUS function code | 0x0F    |
| Byte 8, 9   | Reference number     | 0x0000  |
| Byte 10, 11 | Bit count            | 0x0010  |

Table 92: Exception of Function Code FC15

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x8F         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

#### **Function Code FC16 (Write Multiple Registers)** 11.2.3.9

This function writes a sequence of registers in a slave device in word format.

#### Request

The Request specifies the reference number (starting register), the word count (number of registers to write), and the register data. The data is sent as 2 bytes per register. The registers are zero-based; therefore, the first output is at address 0. Example: Set data in registers 0 and 1

Table 93: Request of Function Code FC16

| Byte        | Field name             | Example       |
|-------------|------------------------|---------------|
| Byte 0, 1   | Transaction identifier | 0x0000        |
| Byte 2, 3   | Protocol identifier    | 0x0000        |
| Byte 4, 5   | Length field           | 0x000B        |
| Byte 6      | Unit identifier        | 0x01 not used |
| Byte 7      | MODBUS function code   | 0x10          |
| Byte 8, 9   | Reference number       | 0x0000        |
| Byte 10, 11 | Word count             | 0x0002        |
| Byte 12     | Byte count             | 0x04          |
| Byte 13, 14 | Register value 1       | 0x1234        |
| Byte 15, 16 | Register value 2       | 0x2345        |

#### Response

Table 94: Response of Function Code FC16

| Byte        | Field name           | Example |
|-------------|----------------------|---------|
|             |                      |         |
| Byte 7      | MODBUS function code | 0x10    |
| Byte 8, 9   | Reference number     | 0x0000  |
| Byte 10, 11 | Word count           | 0x0002  |

Table 95: Exception of Function Code FC16

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x85         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

#### 11.2.3.10 Function Code FC22 (Mask Write Register)

This function manipulates individual bits within a register using a combination of an AND mask, an OR mask, and the register's current content.

### Request

Table 96: Request of Function Code FC22

| Byte        | Field name             | Example       |
|-------------|------------------------|---------------|
| Byte 0, 1   | Transaction identifier | 0x0000        |
| Byte 2, 3   | Protocol identifier    | 0x0000        |
| Byte 4, 5   | Length field           | 0x0002        |
| Byte 6      | Unit identifier        | 0x01 not used |
| Byte 7      | MODBUS function code   | 0x16          |
| Byte 8, 9   | Reference number       | 0x0000        |
| Byte 10, 11 | AND mask               | 0x0000        |
| Byte 12, 13 | OR mask                | 0xAAAA        |

#### Response

Table 97: Response of Function Code FC22

| Byte        | Field name           | Example |
|-------------|----------------------|---------|
|             |                      |         |
| Byte 7      | MODBUS function code | 0x10    |
| Byte 8, 9   | Reference number     | 0x0000  |
| Byte 10, 11 | AND mask             | 0x0000  |
| Byte 12, 13 | OR mask              | 0xAAAA  |

Table 98: Exception of Function Code FC22

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x85         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

## 11.2.3.11 Function Code FC23 (Read/Write Multiple Registers)

This function performs a combination of a read and write operation in a single request. The function can write the new data to a group registers, and then return the data of a different group. The write operation is performed before the read.

#### Request

The reference numbers (addresses) are zero-based in the request message; therefore, the first register is at address 0.

The request message specifies the registers to read and write. The data is sent as 2 bytes per register.

Example: The data in register 3 is set to value 0x0123, and values 0x0004 and 0x5678 are read out of the two registers 0 and 1.

Table 99: Request of Function Code FC23

| Byte          | Field name                                 | Example       |
|---------------|--|---------------|
| Byte 0, 1     | Transaction identifier                     | 0x0000        |
| Byte 2, 3     | Protocol identifier                        | 0x0000        |
| Byte 4, 5     | Length field                               | 0x000D        |
| Byte 6        | Unit identifier                            | 0x01 not used |
| Byte 7        | MODBUS function code 0x17                  |               |
| Byte 8, 9     | Reference number for read 0x0000           |               |
| Byte 10, 11   | Word count for read (1125) 0x0002          |               |
| Byte 12, 13   | Reference number for write                 | 0x0003        |
| Byte 14, 15   | Word count for write (1100) 0x0001         |               |
| Byte 16       | Byte count (2 x word count for write) 0x02 |               |
| Byte 17(B+16) | Register values (B = Byte count)           | 0x0123        |

#### Response

Table 100: Response of Function Code FC23

| Byte        | Field name                           | Example          |  |
|-------------|--------------------------------------|------------------|--|
| Бус         | Ticiu name                           | Example          |  |
| •••         |                                      |                  |  |
| Byte 7      | MODBUS function code                 | 0x17             |  |
| Byte 8      | Byte count (2 x word count for read) | 0x04             |  |
| Byte 9(B+1) | Register values (B = Byte count)     | 0x0004 or 0x5678 |  |

Table 101: Exception of Function Code FC23

| Byte   | Field name           | Example      |
|--------|----------------------|--------------|
|        |                      |              |
| Byte 7 | MODBUS function code | 0x97         |
| Byte 8 | Exception code       | 0x01 or 0x02 |

# Note

Note that if the register ranges overlap, the results are undefined! If register areas for read and write overlap, the results are undefined.

#### 11.2.4 **MODBUS Register Mapping**

The following tables display the MODBUS addressing and the internal variables.

Via the register services the states of the complex and digital I/O modules can be determined or changed.

## Register Access Reading (with FC3 and FC4)

Table 102: Register Access Reading (with FC3 and FC4)

| MODBI      | US address   | IEC 61131     | Memory range  |
|------------|--------------|---------------|---|
| [dec]      | [hex]        | address       |   |
| 0255       | 0x00000x00FF | %IW0%IW255    | Physical input area (1) First 256 Words of physical input data        |
| 256511     | 0x01000x01FF | -             | MODBUS exception: "Illegal data address"                              |
| 512767     | 0x02000x02FF | %QW0%QW255    | Physical output area (1) First 256 Words of physical output data      |
| 7684095    | 0x03000x0FFF | -             | MODBUS exception: "Illegal data address"                              |
| 409612287  | 0x10000x2FFF | -             | Configuration register (see Section "Configuration Register")         |
| 1228824575 | 0x30000x5FFF | -             | MODBUS exception: "Illegal data address"                              |
| 2457625339 | 0x60000x62FB | %IW256%IW1020 | Physical input area (2)<br>Additional 764 Words physical input data   |
| 2534028671 | 0x62FC0x6FFF | -             | MODBUS exception: "Illegal data address"                              |
| 2867229435 | 0x70000x72FB | %QW256%QW1020 | Physical output area (2)<br>Additional 764 Words physical output data |
| 2943665535 | 0x72FC0xFFFF | -             | MODBUS exception: "Illegal data address"                              |

#### Register Access Writing (with FC6 and FC16)

Table 103: Register Access Writing (with FC6 and FC16)

| MODBI      | US address   | IEC 61131     | Memory range  |
|------------|--------------|---------------|---|
| [dec]      | [hex]        | address       |   |
| 0255       | 0x00000x00FF | %QW0%QW255    | Physical output area (1) First 256 Words of physical output data      |
| 256511     | 0x01000x01FF | -             | MODBUS exception: "Illegal data address"                              |
| 512767     | 0x02000x02FF | %QW0%QW255    | Physical output area (1) First 256 Words of physical output data      |
| 7684095    | 0x03000x0FFF | -             | MODBUS exception: "Illegal data address"                              |
| 409612287  | 0x10000x2FFF | -             | Configuration register (see Section "Configuration Register")         |
| 1228824575 | 0x30000x5FFF | -             | MODBUS exception: "Illegal data address"                              |
| 2457625339 | 0x60000x62FB | %QW256%QW1020 | Physical output area (2)<br>Additional 764 Words physical output data |
| 2534028671 | 0x62FC0x6FFF | -             | MODBUS exception: "Illegal data address"                              |
| 2867229435 | 0x70000x72FB | %QW256%QW1020 | Physical output area (2)<br>Additional 764 Words physical output data |
| 2943665535 | 0x72FC0xFFFF | -             | MODBUS exception: "Illegal data address"                              |

The digital MODBUS services (coil services) are bit accesses, with which only the states of digital I/O modules can be determined or changed. Complex I/O modules are not attainable with these services and so they are ignored. Because of this the addressing of the digital channels begins again with 0, so that the MODBUS address is always identical to the channel number, (i.e. the digital input no. 47 has the MODBUS address "46").

## Bit Access Reading (with FC1 and FC2)

Table 104: Bit Access Reading (with FC1 and FC2)

| MODBI      | US address   | Memory range             | Description   |
|------------|--------------|--------------------------|---|
| [dec]      | [hex]        |                          |   |
| 0511       | 0x00000x01FF | Physical input area (1)  | First 512 digital inputs  |
| 5121023    | 0x02000x03FF | Physical output area (1) | First 512 digital outputs   |
| 1024 12287 | 0x04000x2FFF | -                        | MODBUS exception: "Illegal data address"  |
| 1228813815 | 0x30000x35F7 |                          | MODBUS exception: "Illegal data address   |
| 1381616383 | 0x35F80x3FFF | -                        | MODBUS exception: "Illegal data address"  |
| 1638417911 | 0x40000x45F7 |                          | MODBUS exception: "Illegal data address   |
| 1791232767 | 0x45F80x7FFF | -                        | MODBUS exception: "Illegal data address"  |
|            | 0x80000x85F7 | Physical input area (2)  | Starts with the 513 <sup>th</sup> and ends with the 2039 <sup>th</sup> digital input  |
|            | 0x85F80x8FFF |                          | MODBUS exception: "Illegal data address"  |
|            | 0x90000x95F7 | Physical output area (2) | Starts with the 513 <sup>th</sup> and ends with the 2039 <sup>th</sup> digital output |
|            | 0x95F80xFFFF |                          | MODBUS exception: "Illegal data address"  |

# Bit Access Writing (with FC5 and FC15)

Table 105: Bit Access Writing (with FC5 and FC15)

| MODBU      | US address   | Memory range             | Description   |
|------------|--------------|--------------------------|---|
| [dec]      | [hex]        |                          |   |
| 0511       | 0x00000x01FF | Physical output area (1) | First 512 digital outputs   |
| 5121023    | 0x02000x03FF | Physical output area (1) | First 512 digital outputs   |
| 102412287  | 0x04000x2FFF | -                        | MODBUS exception: "Illegal data address"  |
| 1228813815 | 0x30000x35F7 |                          | MODBUS exception: "Illegal data address   |
| 1381616383 | 0x35F80x3FFF | •                        | MODBUS exception: "Illegal data address"  |
| 1638417911 | 0x40000x45F7 |                          | MODBUS exception: "Illegal data address   |
| 1791232767 | 0x45F80x7FFF | -                        | MODBUS exception: "Illegal data address"  |
|            | 0x80000x85F7 | Physical output area (2) | Starts with the 513 <sup>th</sup> and ends with the 2039 <sup>th</sup> digital output |
|            | 0x85F80x8FFF |                          | MODBUS exception: "Illegal data address"  |
|            | 0x90000x95F7 | Physical output area (2) | Starts with the 513 <sup>th</sup> and ends with the 2039 <sup>th</sup> digital output |
|            | 0x95F80xFFFF |                          | MODBUS exception: "Illegal data address"  |

#### **MODBUS Registers** 11.2.5

Table 106: MODBUS Registers

|                  | 6: MODBUS Registers |               |  |
|------------------|---------------------|---------------|--|
| Register address | Access              | Length (Word) | Description  |
| 0x1000           | R/W                 | 1             | Watchdog time read/write                                     |
| 0x1001           | R/W                 | 1 2           | Watchdog coding mask 116                                     |
| 0x1002           | R/W                 | 1             | Watchdog coding mask 1732                                    |
| 0x1003           | R/W                 | 1             | Watchdog trigger   |
| 0x1004           | R                   | 1             | Minimum trigger time   |
| 0x1005           | R/W                 | 1             | Watchdog stop (Write sequence 0xAAAA, 0x5555)                |
| 0x1006           | R                   | 1             | Watchdog status  |
| 0x1007           | R/W                 | 1             | Restart watchdog (Write sequence 0x1)                        |
| 0x1008           | R/W                 | 1             | Stop watchdog (Write sequence 0x55AA or 0xAA55)              |
| 0x1009           | R/W                 | 1             | MODBUS and HTTP close at watchdog time-out                   |
| 0x100A           | R/W                 | 1             | Watchdog configuration                                       |
| 0x100B           | W                   | 1             | Save watchdog parameter (Write sequence 0x55AA or 0xAA55)    |
| 0x1020           | R                   | 1 2           | LED error code   |
| 0x1021           | R                   | 1             | LED error argument   |
| 0x1022           | R                   | 1 4           | Number of analog output data in the process image (in bits)  |
| 0x1023           | R                   | 1 3           | Number of analog input data in the process image (in bits)   |
| 0x1024           | R                   | 1 2           | Number of digital output data in the process image (in bits) |
| 0x1025           | R                   | 1             | Number of digital input data in the process image (in bits)  |
| 0x1028           | R/W                 | 1             | Boot configuration   |
| 0x1029           | R/W                 | 1 9           | MODBUS/TCP statistics (Write sequence 0x55AA or 0xAA55)      |

Table 107: MODBUS registers (Continuation)

#### 11.2.5.1 **Accessing Register Values**

You can use any MODBUS application to access (read from or write to) register values. Both commercial (e.g., "Modscan") and free programs (from http://www.modbus.org/tech.php) are available.

The following sections describe how to access both the registers and their values.

#### 11.2.5.2 **Watchdog Registers**

The watchdog monitors the data transfer between the fieldbus master and the controller. Every time the controller receives a specific request (as define in the watchdog setup registers) from the master, the watchdog timer in the controller resets.

In the case of fault free communication, the watchdog timer does not reach its end value. After each successful data transfer, the timer is reset.

If the watchdog times out, a fieldbus failure has occurred. In this case, the fieldbus controller answers all following MODBUS TCP/IP requests with the exception code 0x0004 (Slave Device Failure).

In the controller special registers are used to setup the watchdog by the master (Register addresses 0x1000 to 0x1008).

By default, the watchdog is not enabled when you turn the controller on. To activate it, the first step is to set/verify the desired time-out value of the Watchdog Time register (0x1000). Second, the function code mask must be specified in the mask register (0x1001), which defines the function code(s) that will reset the timer for the first time. Finally, the Watchdog-Trigger register (0x1003) or the register 0x1007 must be changed to a non-zero value to start the timer subsequently.

Reading the Minimum Trigger time (Register 0x1004) reveals whether a watchdog fault occurred. If this time value is 0, a fieldbus failure is assumed. The

timer of watchdog can manually be reset, if it is not timed out, by writing a value of 0x1 to the register 0x1003 or to the Restart Watchdog register 0x1007.

After the watchdog is started, it can be stopped by the user via the Watchdog Stop register (0x1005) or the Simply Stop Watchdog register (0x1008).

The watchdog registers can be addressed in the same way as described with the MODBUS read and write function codes. Specify the respective register address in place of the reference number.

Table 108: Register Address 0x1000

| Register address 0x1000 (4096 <sub>dec</sub> ) |  |  |  |  |  |  |  |  |  |  |
|--|--|--|--|--|--|--|--|--|--|--|
| Value  | Watchdog time, WS_TIME   |  |  |  |  |  |  |  |  |  |
| Access   | Lead/write   |  |  |  |  |  |  |  |  |  |
| Default  | x0064  |  |  |  |  |  |  |  |  |  |
| Description                                    | This register stores the watchdog timeout value as an unsigned 16 bit value. The default value is 0. Setting this value will not trigger the watchdog. However, a non zero value must be stored in this register before the watchdog can be triggered. The time value is stored in multiples of 100ms (e.g., 0x0009 is .9 seconds). It is not possible to modify this value while the watchdog is running. |  |  |  |  |  |  |  |  |  |

Table 109: Register Address 0x1001

| Register addres | s 0x1001 (4097 <sub>dec</sub> )  |
|-----------------|--|
| Value           | Watchdog function coding mask, function code 116, WDFCM_1_16   |
| Access          | Read/write   |
| Default         | 0xFFFF   |
| Description     | Using this mask, the function codes can be set to trigger the watchdog function. The function code can be selected via a "1"  FC 1 Bit 0 FC 2 Bit 1 FC 3 Bit 2 FC 4 Bit 3 FC 5 Bit 4 FC 16 Bit 15  Changes to the register value can only be made if the watchdog is deactivated. The bit pattern stored in the register defines the function codes that trigger the |
|                 | watchdog. Some function codes are not supported. For those the watchdog will not be triggered even if another MODBUS device transmits one of them.   |

Table 110: Register Address 0x1002

| Register addre | ss 0x1002 (4098 <sub>dec</sub> )  |  |  |  |  |  |  |  |  |  |
|----------------|---|--|--|--|--|--|--|--|--|--|
| Value          | Watchdog function coding mask, function code 1732, WD_FCM_17_32   |  |  |  |  |  |  |  |  |  |
| Access         | Lead/write  |  |  |  |  |  |  |  |  |  |
| Default        | xFFFF   |  |  |  |  |  |  |  |  |  |
| Description    | Same function as above, however, with the function codes 17 to 32.  |  |  |  |  |  |  |  |  |  |
|                | FC 17 Bit 0 FC 18 Bit 1 FC 32 Bit 15  These codes are currently not supported, for this reason the default value should not be changed. Changes to the register value can only be made if the watchdog is deactivated. It is not possible to modify this value while the watchdog is running. |  |  |  |  |  |  |  |  |  |

Table 111: Register Address 0x1003

| Register addres | Register address 0x1003 (4099 <sub>dec</sub> )   |  |  |  |  |  |  |  |  |
|-----------------|--|--|--|--|--|--|--|--|--|
| Value           | Watchdog trigger, WD_TRIGGER   |  |  |  |  |  |  |  |  |
| Access          | lead/write   |  |  |  |  |  |  |  |  |
| Standard        | (0000  |  |  |  |  |  |  |  |  |
| Description     | This register is used for an alternative trigger method. The watchdog is triggered by writing different values in this register. Values following each other must differ in size. Writing of a value not equal to zero starts the watchdog after a Power-on. For a restart the written value must necessarily be unequal the before written value! A watchdog fault is reset and writing process data is possible again. |  |  |  |  |  |  |  |  |

Table 112: Register Address 0x1004

| Register address 0x1004 (4100 <sub>dez</sub> ) |  |  |  |  |  |  |  |  |  |  |
|--|--|--|--|--|--|--|--|--|--|--|
| Value  | Minimum current trigger time, WD_AC_TRG_TIME   |  |  |  |  |  |  |  |  |  |
| Access   | Read   |  |  |  |  |  |  |  |  |  |
| Standard                                       | )xFFFF   |  |  |  |  |  |  |  |  |  |
| Description                                    | This register saves the minimum current watchdog trigger time. If the watchdog is triggered, the saved value is compared with the current value. If the current value is smaller than the saved value, this is replaced by the current value. The unit is 100 ms/digit. The saved value is changed by writing new values, which does not affect the watchdog. 0x0000 is not permissible. |  |  |  |  |  |  |  |  |  |

Table 113: Register Address 0x1005

| Register address 0x1005 (4101 <sub>dez</sub> ) |   |  |  |  |  |  |  |  |
|--|---|--|--|--|--|--|--|--|
| Value  | op watchdog, WD_AC_STOP_MASK  |  |  |  |  |  |  |  |
| Access   | ead/write   |  |  |  |  |  |  |  |
| Standard                                       | 0x0000  |  |  |  |  |  |  |  |
| Description                                    | The watchdog is stopped if here the value 0xAAAA is written first, followed by 0x5555. The watchdog fault reaction is blocked. A watchdog fault is reset and writing on the process data is possible again. |  |  |  |  |  |  |  |

Table 114: Register Address 0x1006

| Register address 0x1006 (4102 <sub>dez</sub> ) |   |  |  |  |  |  |  |  |  |  |
|--|---|--|--|--|--|--|--|--|--|--|
| Value  | While watchdog is running, WD_RUNNING   |  |  |  |  |  |  |  |  |  |
| Access   | ead   |  |  |  |  |  |  |  |  |  |
| Standard                                       | 0x0000  |  |  |  |  |  |  |  |  |  |
| Description                                    | Current watchdog status. at 0x0000: Watchdog not active at 0x0001: Watchdog active at 0x0002: Watchdog exhausted. |  |  |  |  |  |  |  |  |  |

#### Table 115: Register Address 0x1007

| Register address 0x1007 (4103 <sub>dez</sub> ) |   |  |  |  |  |  |  |
|--|---|--|--|--|--|--|--|
| Value  | start watchdog, WD_RESTART  |  |  |  |  |  |  |
| Access   | Read/write  |  |  |  |  |  |  |
| Standard                                       | 0x0000  |  |  |  |  |  |  |
| Description                                    | This register restarts the watchdog timer by writing a value of 0x1 into it. If the watchdog was stopped before the overrun, it is not restarted. |  |  |  |  |  |  |

#### Table 116: Register Address 0x1008

| Register addre | Register address 0x1008 (4104 <sub>dez</sub> )  |  |  |  |  |  |  |  |
|----------------|---|--|--|--|--|--|--|--|
| Value          | Simply stop watchdog, WD_AC_STOP_SIMPLE   |  |  |  |  |  |  |  |
| Access         | ead/write   |  |  |  |  |  |  |  |
| Standard       | 0x0000  |  |  |  |  |  |  |  |
| Description    | This register stops the watchdog by writing the value 0xAA55 or 0x55AA into it. The watchdog timeout fault is deactivated and it is possible to write in the watchdog register again. If there is an existing watchdog fault, it is reset |  |  |  |  |  |  |  |

#### Table 117: Register Address 0x1009

| Register address 0x1009 (4105 <sub>dez</sub> )                         |  |  |  |  |  |  |  |  |
|--|--|--|--|--|--|--|--|--|
| Value  | ose MODBUS socket after watchdog timeout |  |  |  |  |  |  |  |
| Access   | Read/write                               |  |  |  |  |  |  |  |
| Description  0: MODBUS socket is not closed 1: MODBUS socket is closed |  |  |  |  |  |  |  |  |

#### Table 118: Register Address 0x100A

| Register addres | Register address 0x100A (4106 <sub>dez</sub> )   |  |  |  |  |  |  |  |  |
|-----------------|--|--|--|--|--|--|--|--|--|
| Value           | Alternative watchdog   |  |  |  |  |  |  |  |  |
| Access          | Read/write   |  |  |  |  |  |  |  |  |
| Standard        | 0x0000   |  |  |  |  |  |  |  |  |
| Description     | This register provides an alternate way to activate the watchdog timer. Procedure: Write a time value in register 0x1000; then write a 0x0001 into register 0x100A. With the first MODBUS request, the watchdog is started. The watchdog timer is reset with each MODBUS/TCP instruction. If the watchdog times out, all outputs are set to zero. The outputs will become operational again, after communications are re-established.  Register 0x00A is non-volatile, including register 0x1000.  It is not possible to modify the time value in register 0x1000 while the watchdog is running. |  |  |  |  |  |  |  |  |

The length of each register is 1 word; i.e., with each access only one word can be written or read. Following are two examples of how to set the value for a time overrun:

#### Setting the watchdog for a timeout of more than 1 second:

- 1. Write 0x000A in the register for time overrun (0x1000). Register 0x1000 works with a multiple of 100 ms; 1 s = 1000 ms;  $1000 \text{ ms} / 100 \text{ ms} = 10_{\text{dec}} = A_{\text{hex}}$ )
- 2. Use the function code 5 to write  $0x0010 (=2^{(5-1)})$  in the coding mask (register 0x1001).

Table 119: Starting Watchdog

| FC  | FC16       | FC15 | FC14 | FC13 | FC12 | FC11 | FC10 | FC9 | FC8 | FC7 | FC6 | FC5 | FC4 | FC3 | FC2 | FC1 |
|-----|------------|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit | 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| bin | 0          | 0    | 0    | 0    | 0    | 0    | 0    | 0   | 0   | 0   | 0   | 1   | 0   | 0   | 0   | 0   |
| hex | <b>x</b> 0 |      | 0    |      |      | 1    |      |     |     | 0   |     |     |     |     |     |     |

Function code 5 (writing a digital output bit) continuously triggers the watchdog to restart the watchdog timer again and again within the specified time. If time between requests exceeds 1 second, a watchdog timeout error occurs.

3. To stop the watchdog, write the value 0xAA55 or 0x55AA into 0x1008 (Simply Stop Watchdog register, WD AC STOP SIMPLE).

#### Setting the watchdog for a timeout of 10 minutes or more:

- 1. Write 0x1770 (= 10\*60\*1000 ms / 100 ms) in the register for time overrun (0x1000).
  - (Register 0x1000 works with a multiple of 100 ms; 10 min = 600,000 ms; 600,000 ms / 100 ms = 6000 dec = 1770 hex)
- 2. Write 0x0001 in the watchdog trigger register (0x1003) to start the watchdog.
- 3. Write different values (e.g., counter values 0x0000, 0x0001) in the watchdog to trigger register (0x1003).

Values following each other must differ in size. Writing of a value not equal to zero starts the watchdog. Watchdog faults are reset and writing process data is possible again.

4. To stop the watchdog, write the value 0xAA55 or 0x55AA into 0x1008 (Simply Stop Watchdog register, WD AC STOP SIMPLE).

Table 120: Register Address 0x100B

| Register address 0x100B (4107 <sub>dez</sub> ) |   |
|--|---|
| Value  | Save watchdog parameter   |
| Access   | Write   |
| Standard                                       | 0x0000  |
| Description                                    | With writing of '0x55AA' or '0xAA55' in register 0x100B the registers 0x1000, 0x1001, 0x1002 are set on remanent. |

#### **Diagnostic Registers** 11.2.5.3

The following registers can be read to determine errors in the node:

Table 121: Register Address 0x1020

| Register address 0x1020 (4128 <sub>dec</sub> ) |                               |
|--|-------------------------------|
| Value  | LedErrCode                    |
| Access   | Read                          |
| Description                                    | Declaration of the error code |

Table 122: Register Address 0x1021

| Register address 0x1021 (4129 <sub>dec</sub> ) |                                   |
|--|-----------------------------------|
| Value  | LedErrArg                         |
| Access   | Read                              |
| Description                                    | Declaration of the error argument |

#### **Configuration Registers** 11.2.5.4

The following registers contain configuration information of the connected modules:

Table 123: Register Address 0x1022

| Register address 0x1022 (4130 <sub>dec</sub> ) |  |
|--|--|
| Value  | CnfLen.AnalogOut   |
| Access   | Read   |
| Description                                    | Number of word-based outputs registers in the process image in bits (divide by 16 to get the total number of analog words) |

Table 124: Register Address 0x1023

| Register address 0x1023 (4131 <sub>dec</sub> ) |   |
|--|---|
| Value  | CnfLen.AnalogInp  |
| Access   | Read  |
| Description                                    | Number of word-based inputs registers in the process image in bits (divide by 16 to get the total number of analog words) |

Table 125: Register Address 0x1024

| Register address 0x1024 (4132 <sub>dec</sub> ) |  |
|--|--|
| Value  | CnfLen.DigitalOut                                  |
| Access   | Read   |
| Description                                    | Number of digital output bits in the process image |

Table 126: Register Address 0x1025

| Register address 0x1025 (4133 <sub>dec</sub> ) |   |
|--|---|

| Access   | Read  |
| Description                                    | Number of digital input bits in the process image |

Table 127: Register Address 0x1028

| Register address 0x1028 (4136 <sub>dec</sub> ) |                                   |
|--|-----------------------------------|
| Value  | Boot options                      |
| Access   | Read/write                        |
| Description                                    | Boot configuration:               |
|  | 1: BootP                          |
|  | 2: DHCP                           |
|  | 3: BootP-Request before static IP |
|  | 4: EEPROM                         |

Table 128: Register Address 0x1029

| Register addres | s 0x1029 (4137 <sub>dec</sub> ) with 9 words |               |   |
|-----------------|--|---------------|---|
| Value           | MODBUS TCP statistics                        |               |   |
| Access          | Read/write                                   |               |   |
| Description     | 1 word SlaveDeviceFailure                    | $\rightarrow$ | internal bus error, fieldbus error by activated watchdog                        |
|                 | 1 word BadProtocol                           | $\rightarrow$ | error in the MODBUS TCP header  |
|                 | 1 word BadLength                             | $\rightarrow$ | Wrong telegram length   |
|                 | 1 word BadFunction                           | $\rightarrow$ | Invalid function code   |
|                 | 1 word BadAddress                            | $\rightarrow$ | Invalid register address  |
|                 | 1 word BadData                               | $\rightarrow$ | Invalid value   |
|                 | 1 word TooManyRegisters                      | $\rightarrow$ | Number of the registers which can be worked on is too large, Read/Write 125/100 |
|                 | 1 word TooManyBits                           | $\rightarrow$ | Number of the coils which can be worked on is too large, Read/Write 2000/800    |
|                 | 1 word ModTcpMessageCounter                  | $\rightarrow$ | Number of received MODBUS/TCP requests  |
|                 | With writing 0xAA55 or 0x55AA                | in            | the register will reset this data area.   |

### Table 129: Register Address 0x102A

| Register address 0x102A (4138 <sub>dec</sub> ) with a word count of 1 |                           |
|---|---------------------------|
| Value   | MODBUS/TCP connections    |
| Access  | Read                      |
| Description   | Number of TCP connections |

### Table 130: Register Address 0x102B

| Register address 0x102B (4139 <sub>dez</sub> ) with a word count of up to 1 |  |
|---|--|
| Value   | KBUS reset   |
| Access  | Write  |
| Description   | Writing of this register restarts the internal bus |

Table 131: Register Address 0x1030

| Register address 0x1030 (4144 <sub>dec</sub> ) with a word count of 1 |   |
|---|---|
| Value   | Configuration MODBUS/TCP time-out   |
| Access  | Read/write  |
| Default   | 0x0258 (600 decimal)  |
| Description   | This is the maximum number of milliseconds the fieldbus coupler will allow a MODBUS/TCP connection to stay open without receiving a MODBUS request. Upon time-out, idle connection will be closed. Outputs remain in last state. Default value is 600 ms (60 seconds), the time base is 100 ms, the minimal value is 100 ms. If the value is set to '0', the timeout is disabled. On this connection, the watchdog is triggered with a request. |

Table 132: Register Address 0x1031

| Register address 0x1031 (4145 <sub>dec</sub> ) with a word count of 3 |  |  |
|---|--|--|
| Value   | Value Read the MAC-ID of the controller                  |  |
| Access  | Read   |  |
| Description   | This register gives the MAC-ID, with a length of 3 words |  |

Table 133: Register Address 0x1037

| Register addre | Register address 0x1031 (4151 <sub>dez</sub> ) with a word count of 3 |  |  |  |
|----------------|---|--|--|--|
| Value          | Configuration of Modbus Response Delay Time                           |  |  |  |
| Access         | Read/write  |  |  |  |
| Default        | 0x0000  |  |  |  |
| Description    |   |  |  |  |
|                | connection. The time base is 1 ms. On the Modbus TCP connection, the  |  |  |  |
|                | response will be delayed by the inscribed time.                       |  |  |  |

|--|--|
| Value  | Description, INFO_LOADER_INFO                            |
| Access   | Read   |
| Description  | Information to the programming of the firmware, 32 words |

# 11.2.5.6 Constant Registers

The following registers contain constants, which can be used to test communication with the master:

Table 152: Register Address 0x2000

| Register address 0x2000 (8192 <sub>dec</sub> ) |                     |
|--|---------------------|
| Value  | Zero, GP_ZERO       |
| Access   | Read                |
| Description                                    | Constant with zeros |

Table 153: Register Address 0x2001

| Register addres | Register address 0x2001 (8193 <sub>dec</sub> )  |  |
|-----------------|---|--|
| Value           | Ones, GP_ONES   |  |
| Access          | Read  |  |
| Description     | Constant with ones  - 1 if this is declared as "signed int"  MAXVALUE if it is declared as "unsigned int" |  |

Table 154: Register Address 0x2002

| Register address 0x2002 (8194 <sub>dec</sub> ) |  |
|--|--|
| Value  | 1,2,3,4, GP_1234   |
| Access   | Read   |
| Description                                    | This constant value is used to test the Intel/Motorola format specifier. If the master reads a value of 0x1234, then with Intel format is selected – this is the correct format. If 0x3412 appears, Motorola format is selected. |

Table 155: Register Address 0x2003

| Register address 0x2003 (8195 <sub>dec</sub> ) |   |
|--|---|
| Value  | Mask 1, GP_AAAA   |
| Access   | Read  |
| Description                                    | This constant is used to verify that all bits are accessible to the fieldbus master. This will be used together with register 0x2004. |

Table 156: Register Address 0x2004

| Register address 0x2004 (8196 <sub>dec</sub> ) |   |
|--|---|
| Value  | Mask 1, GP_5555   |
| Access   | Read  |
| Description                                    | This constant is used to verify that all bits are accessible to the fieldbus master. This will be used together with register 0x2003. |

Table 157: Register Address 0x2005

| Register address 0x2005 (8197 <sub>dec</sub> ) |  |  |  |
|--|--|--|--|
| Value  | Maximum positive number, GP_MAX_POS      |  |  |
| Access   | Read                                     |  |  |
| Description                                    | Constant in order to control arithmetic. |  |  |

Table 158: Register Address 0x2006

| Register address 0x2006 (8198 <sub>dec</sub> ) |   |  |  |  |
|--|---|--|--|--|

# 11.3 EtherNet/IP (Ethernet/Industrial Protocol)

### 11.3.1 **General**

EtherNet/IP stands for Ethernet Industrial Protocol and defines an open industry standard that extends the classic Ethernet with an industrial protocol. This standard was jointly developed by ControlNet International (CI) and the Open DeviceNet Vendor Association (ODVA) with the help of the Industrial Ethernet Association (IEA).

This communication system enables devices to exchange time-critical application data in an industrial environment. The spectrum of devices ranges from simple I/O devices (e.g., sensors) through to complex controllers (e.g., robots).

EtherNet/IP is based on the TCP/IP protocol family and consequently uses the bottom 4 layers of the OSI layer model in unaltered form so that all standard Ethernet communication modules such as PC interface cards, cables, connectors, hubs and switches can also be used with EtherNet/IP.

Positioned above the transport layer is the encapsulation protocol, which enables use of the Control & Information Protocol (CIP) on TCP/IP and UDP/IP.

CIP, as a major network independent standard, is already used with ControlNet and DeviceNet. Therefore, converting from one of these protocols to EtherNet/IP is easy to do. Data exchange takes place with the help of an object model.

In this way, ControlNet, DeviceNet and EtherNet/IP have the same application protocol and can therefore jointly use device profiles and object libraries. These objects enable plug-and-play interoperability between complex devices of different manufacturers.

#### 11.3.2 Protocol overview in the OSI model

In order to clarify the interrelationships between DeviceNet, ControlNet and EtherNet/IP, the following diagram presents the associated ISO/OSI reference model.

Table 161: ISO/OSI reference model

| 7<br>Application<br>Layer  | (Comn                | Object Library<br>nunications, Applications,<br>Synchronization) | Safety Object<br>Library        | Comon                           |                            |  |  |

# 11.3.3 Characteristics of the EtherNet/IP Protocol Software

The EtherNet/IP product classes are divided into 4 levels with each level containing a particular functionality. Each higher level in turn possesses at least the functionality of a lower level. The fieldbus coupler supports levels 1 and 2 of the EtherNet/IP product classes, which immediately build on each other.

Level 2

Level 1

Level 2: Level 1 + I/O Messages Server

Level 1: Explicit Messages Server

- Unconnected Message Manager (UCMM) client and server
- 128 Encapsulation Protocol sessions
- 128 Class 3 or Class 1 connections combined
  - Class 3 connection explicit messages (connection oriented, client and server)
  - Class 1 connection I/O messages (connection oriented, client and server)

### 11.3.4 EDS File

The "Electronic Data Sheets" file (EDS file for short) contains the characteristics of the fieldbus coupler/controller and information regarding its communication capabilities. The EDS file required for Ethernet/IP operation is imported and installed by the corresponding configuration software.

# **Note**

### **Downloading the EDS file!**

You can download the EDS file in the download area of the WAGO web site: <a href="http://www.wago.com">http://www.wago.com</a>.

# Information

# Information about installing the EDS file

When installing the EDS file, refer to the information provided in the documentation of the configuration software, which you are using.

#### 194

# 11.3.5 Object Model

### 11.3.5.1 General

For network communication, Ethernet/IP utilizes an object model in which all functions and data of a device are described.

Each node in the network is depicted as a collection of objects.

The object model contains terms that are defined as follows:

#### **Object:**

An object is an abstract representation of individual, related components within a device. It is determined by its data or attributes, its outwardly applied functions or services, and by its defined behavior.

#### Class:

A class describes a series of objects which all represent the same type of system components. A class is the generalization of an object. All objects in a class are identical as regards form and behavior, but can comprise differing attribute values.

#### Instance:

An instance describes a specific and physical occurrence of an object. The terms "object," "instance" and "object instance" all refer to a specific instance. Different instances of a class have the same services, the same behavior and the same variables (attributes). However, you can have different variable values. For example, Finland is an instance of the "Land" object class.

#### Variable:

The variables (attributes) describe an externally visible characteristic or the function of an object. Typical attributes include configuration or status information.

For example, the ASCII name of an object or the repetition frequency of a periodic object is output.

#### **Service:**

A service is a function supported by an object and/or an object class. CIP defines a group of common services that are applied to the attributes. These services execute specified actions.

Example: Reading variables.

#### **Behavior:**

The behavior specifies how an object functions. The functions result from various occurrences, which are determined by the object, e.g. receiving service requests, recording internal errors or the sequence of timers.

#### 11.3.5.2 Class Overview

CIP classes are included in the CIP specification of ODVA. They describe the properties (Volume 1, "Common Industrial Protocol") of Ethernet and CAN independent of their physical interface. The physical interface is described in a separate specification. For Ethernet/IP, this is Volume 2 ("Ethernet/IP Adaptation of CIP"), which describes the adaption of Ethernet /IP to CIP.

For this purpose, WAGO uses classes  $01_{hex}$ ,  $02_{hex}$ ,  $04_{hex}$ ,  $05_{hex}$ ,  $06_{hex}$  and  $F4_{hex}$ , which are described in Volume 1 ("Common Industrial Protocol"). Classes  $F5_{hex}$  and  $F6_{hex}$  are supported from Volume 2 ("Ethernet/IP Adaptation of CIP").

WAGO-specific classes listed in the overview table below are also available.

All CIP Common classes listed and the WAGO-specific classes listed below that are described in detail in the following individual sections after a brief explanation of the table headings in the object descriptions.

Table 162: CIP common class

| Class  | Name                    |
|--------|-------------------------|
| 01 hex | Identity                |
| 02 hex | Message Router          |
| 04 hex | Assembly                |
| 05 hex | Connection              |
| 06 hex | Connection Manager      |
| F5 hex | TCP/IP Interface Object |
| F6 hex | Ethernet Link Object    |

Table 163: WAGO specific classes

| Class  | Name                                    |
|--------|---|
| 64 hex | Coupler/Controller Configuration Object |
| 65 hex | Discrete Input Point                    |
| 66 hex | Discrete Output Point                   |
| 67 hex | Analog Input Point                      |
| 68 hex | Analog Output Point                     |
| 69 hex | Discrete Input Point Extended 1         |
| 6A hex | Discrete Output Point Extended 1        |
| 6B hex | Analog Input Point Extended 1           |
| 6C hex | Analog Output Point Extended 1          |
| 6D hex | Discrete Input Point Extended 2         |
| 6E hex | Discrete Output Point Extended 2        |
| 6F hex | Analog Input Point Extended 2           |
| 70 hex | Analog Output Point Extended 2          |
| 71 hex | Discrete Input Point Extended 3         |
| 72 hex | Discrete Output Point Extended 3        |
| 73 hex | Analog Input Point Extended 3           |

| 74 hex | Analog Output Point Extended 3  |
|--------|---------------------------------|
| 80 hex | Module Configuration            |
| 81 hex | Module Configuration Extended 1 |

#### **Explanation of the Table Headings in the Object Descriptions** 11.3.5.3

Table 164: Explanation of the table headings in the object descriptions

| Table heading | Description   |  |  |  |
|---------------|---|--|--|--|
| Attribute ID  | Integer value which is assigned to the corresponded attribute   |  |  |  |
| Access        | Set: The attribute can be accessed by means of Set_Attribute services.  Note Response also possible with Get_Attribute service! All the set attributes can also be accessed by means of Get_Attribute services.  Get: The attribute can be accessed by means of Get_Attribute services.  Get_Attribute_All: Delivers content of all attributes.  Set_Attribute_Single: Modifies an attribute value.  Reset: Performs a restart.  0: Restart |  |  |  |
| NV            | 1: Restart and restoration of factory settings  NV (non volatile): The attribute is permanently stored in the controller.  V (volatile): The attribute is not permanently stored in the controller.  Note  Without specifying, the attribute is not saved! If this column is missing, all attributes have the type V (volatile).  |  |  |  |
| Name          | Designation of the attribute  |  |  |  |
| Data type     | Designation of the CIP data type of the attribute   |  |  |  |
| Description   | Short description for the Attribute   |  |  |  |
| Default value | Factory settings  |  |  |  |

#### Identity (01 hex) 11.3.5.4

The "Identity" class provides general information about the fieldbus coupler/controller that clearly identifies it.

# **Instance 0 (Class Attributes)**

Table 165: Identity (01 hex) – Class

| Attribute ID | Access | Name                                | Data type | Description                           | Default value |
|--------------|--------|-------------------------------------|-----------|---------------------------------------|---------------|
| 1            | Get    | Revision                            | UINT      | Revision of this object               | 1 (0x0001)    |
| 2            | Get    | Max Instance                        | UINT      | Maximum instance                      | 1 (0x0001)    |
| 3            | Get    | Max ID number of class attributes   | UINT      | Maximum number of class attributes    | 0 (0x0000)    |
| 4            | Get    | Max ID number of instance attribute | UINT      | Maximum number of instance attributes | 0 (0x0000)    |

# **Instance 1**

Table 166: Identity (01 hex) – Instance 1

| Attribute ID | Access | Name           | Data type        | Description                             | Default v  | alue  |  |

| 6            | Get    | Serial Number  | UINT             | Serial number                           |  | digits of MAC ID  |  |
| 7            | Get    | Product Name   | SHORT_<br>STRING | Product name                            |  | -   |  |

### **Common Services**

Table 167: Identity (01 hex) - Common service

| Service code | Service available |          | Service name         | Description  |
|--------------|-------------------|----------|----------------------|--|
|              | Class             | Instance |                      |  |
| 01 hex       | Yes               | Yes      | Get_Attribute_All    | Supplies contents of all attributes  |
| 05 hex       | No                | Yes      | Reset                | Implements the reset service Service parameter  0: Emulates a Power On reset |
|              |                   |          |                      | 1: Emulates a Power On reset and re-<br>establishes factory settings         |
| 0E hex       | No                | Yes      | Get_Attribute_Single | Supplies contents of the appropriate attribute                               |

#### 11.3.5.5 Message Router (02 hex)

The "Message Router Object" provides connection points (in the form of classes or instances), which can use a client for addressing services (reading, writing). These messages can be transmitted both when connected and when unconnected from the client to the fieldbus coupler.

### **Instance 0 (Class Attributes)**

Table 168: Message router (02 hex) – Class

| Attribute ID | Access | Name                                 | Data type | Description                           | <b>Default value</b> |
|--------------|--------|--------------------------------------|-----------|---------------------------------------|----------------------|
| 1            | Get    | Revision                             | UINT      | Revision of this object               | 1 (0x0001)           |
| 2            | Get    | Number of Attributes                 | UINT      | Number of attributes                  | 0 (0x0000)           |
| 3            | Get    | Number of Services                   | UINT      | Number of services                    | 0 (0x0000)           |
| 4            | Get    | Max ID Number of Class Attributes    | UINT      | Maximum number of class attributes    | 0 (0x0000)           |
| 5            | Get    | Max ID Number of Instance Attributes | UINT      | Maximum number of instance attributes | 0 (0x0000)           |

# Note

Get Attribute All service can only be used!

The class attributes are only accessible with the Get Attribute All service.

#### **Instance 1**

Table 169: Message router (02 hex) – Instance 1

| Attribute ID | Access | Name            | Data type  | Description                                      | Default value  |

#### **Common Services**

Table 170: Message router (02 hex) – Common service

| Service code | Service available |          | Service-Name         | Description                                    |
|--------------|-------------------|----------|----------------------|--|
|              | Class             | Instance |                      |  |
| 01 hex       | Yes               | No       | Get_Attribute_All    | Supplies contents of all attributes            |
| 0E hex       |                   |          | Get_Attribute_Single | Supplies contents of the appropriate attribute |

#### Assembly Object (04 hex) 11.3.5.6

By means of the assembly classes, even several diverse objects can be combined. These could be, for example, input and output data, status and control information or diagnostic information. WAGO uses the manufacturer-specific instances in order to provide these objects for you in various arrangements. This gives you an efficient way to exchange process data. The following is a description of the individual static assembly instances with their contents and arrangements.

# **Static Assembly Instances – Overview**

Table 171: Static assembly instances – Overview

| Instance                          | Description                                  |
|-----------------------------------|--|
| Instance 101 (65 hex)             | for analog and digital output data           |
| Instance 102 (66 hex)             | for digital output data                      |
| Instance 103 (67 hex)             | for analog output data                       |
| Instance 104 (68 hex)             | for analog and digital input data and status |
| Instance 105 (69 hex)             | for digital input data and status            |
| Instance 106 (6A hex)             | for analog input data and status             |
| Instance 107 (6B hex)             | for analog and digital input data            |
| Instance 108 (6C <sub>hex</sub> ) | for digital input data                       |
| Instance 109 (6D <sub>hex</sub> ) | for analog input data                        |

# **Instance 0 (Class Attributes)**

Table 172: Assembly (04 hex) – Class

| Attribute ID | Access | Name     | Data type | Description             | <b>Default value</b> |
|--------------|--------|----------|-----------|-------------------------|----------------------|
| 1            | Get    | Revision | UINT      | Revision of this object | 2 (0x0002)           |

# Instance 101 (65<sub>hex</sub>)

This assembly instance contains analog and digital output data.

Table 173: Static assembly instances – Instance 101 (65 hex)

# Instance 108 (6Chex)

This assembly instance contains digital input data.

Table 180: Static assembly instances – Instance 108 (6C hex)

| Attribute ID | Access | Name | Data type     | Description                    | <b>Default value</b> |
|--------------|--------|------|---------------|--------------------------------|----------------------|
| 3            | Get    | Data | ARRAY of BYTE | Reference of the process       | -                    |
|              |        |      |               | image: only digital input data |                      |

### Instance 109 (6D<sub>hex</sub>)

This assembly instance contains analog input data.

Table 181: Static assembly instances – Instance 109 (6C hex)

| Attribute ID | Access | Name | Data type     | Description                   | <b>Default value</b> |
|--------------|--------|------|---------------|-------------------------------|----------------------|
| 3            | Get    | Data | ARRAY of BYTE | Reference of the process      | -                    |
|              |        |      |               | image: only analog input data |                      |

# Instance 198 (C6 hex) "Input Only"

This instance is used to establish a connection when no outputs are to be addressed or when inputs, which are already being used in an exclusive owner connection, are to be interrogated. The data length of this instance is always zero. This instance can only be used in the "consumed path" (seen from the slave device).

# Instance 199 (C7 hex) "Listen only"

This instance is used to establish a connection based on an existing exclusive owner connection. The new connection also has the same transmission parameters as the exclusive owner connection. When the exclusive owner connection is cleared, this connection, too, is automatically cleared. The data length of this instance is always zero.

This instance can only be used in the "consumed path" (from the point of view of the slave device).

#### **Common Service**

Table 182: Static assembly instances – Common service

| Service code | Service available |     | Service name         | Description                                    |  |
|--------------|-------------------|-----|----------------------|--|--|
|              | Class Instance    |     |                      |  |  |
| 0E hex       | Yes               | Yes | Get_Attribute_Single | Supplies contents of the appropriate attribute |  |
| 10 hex       | No Yes            |     | Set_Attribute_Single | Modifies an attribute value                    |  |

The software inspects the writing of attribute 3 of assembly instances 101, 102 and 103. If the limit value has been exceeded, it is identified and, if necessary, corrected. However, a write request is not rejected. This means that if less data is received than expected, only this data is written. If more data is received than expected, the received data at the upper limit is deleted. In the case of explicit messages, however, a defined CIP is generated even though the data has been written.

#### 11.3.5.7 Connection (05 hex)

Because the connections are established and terminated via the connection manager, the class and instance attributes of this class are not visible.

# 11.3.5.8 Connection Manager (06 hex)

The "Connection Manager Object" provides the internal resources that are required for the input and output data and explicit messages. In addition, the administration of this resource is an assignment of the "Connection Manager Object".

For each connection (input and output data or explicit), another instance of the connection class is created. The connection parameters are extracted from the "Forward Open" service, which is responsible for establishing a connection.

The following services are supported for the first instance:

- Forward Open
- Unconnected Send
- Forward Close

No class and instance attributes are visible.

# 11.3.5.9 Port Class (F4 hex)

The "Port Class Object" specifies the existing CIP ports on the fieldbus coupler/coupler. There is one instance for each CIP port.

# **Instance 0 (Class Attributes)**

Table 183: Port class (F4 hex) – Class

| Attribute ID | Access            | Name         | Data type                  | Description   | Default value  |

# 11.3.5.10 TCP/IP Interface (F5 hex)

The "TCP/IP Interface Object" provides for the configuration of the TCP/IP network interface of a fieldbus coupler/controller. Examples of configurable objects include the IP address, the network mask and the gateway address of the fieldbus coupler/controller.

The underlying physical communications interface that is connected with the TCP/IP interface object can be any interface supported by the TCP/IP protocol. Examples of components that can be connected to a TCP/IP interface object include the following: an Ethernet interface 802.3, an ATM (Asynchronous Transfer Mode) interface or a serial interface for protocols such as PPP (Point-to-Point Protocol).

The TCP/IP interface object provides an attribute, which is identified by the link-specific object for the connected physical communications interface. The link-specific object should typically provide link-specific counters as well as any link-specific configuration attributes.

Each device must support exactly one instance of the TCP/IP interface object for each TCP/IP-compatible communications interface. A request for access to the first instance of the TCP/IP interface object must always refer to the instance connected with the interface, which is used to submit the request.

# **Instance 0 (Class Attributes)**

# 11.3.5.11 Ethernet Link (F6 hex)

The "Ethernet Link Object" contains link-specific counter and status information for an Ethernet 802.3 communications interface. Each device must support exactly one instance of the Ethernet Link Object for each Ethernet IEEE 802.3 communications interface on the module. An Ethernet link object instance for an internal interface can also be used for the devices, e.g. an internal port with an integrated switch.

# **Instance 0 (Class Attributes)**

### **Common Services**

Table 193: Ethernet link (F6 hex) – Common service

| Service code | Service available |          | Service-Name         | Description                                    |
|--------------|-------------------|----------|----------------------|--|
|              | Class             | Instance |                      |  |
| 01 hex       | Yes               | Yes      | Get_Attribute_All    | Supplies contents of all attributes            |
| 0E hex       | Yes               | Yes      | Get_Attribute_Single | Supplies contents of the appropriate attribute |
| 10 hex       | No                | Yes      | Set_Attribute_Single | Modifies an attribute value                    |

# Note

Changes with service "Set Attribute Single" not directly effective! Attributes (particularly the attributes 6 and 9) which were changed over the service "Set\_Attribute\_Single", become only effective after the next Power-On-Reset of the controller.

# 11.3.5.12 Coupler/Controller Configuration (64 hex)

The fieldbus coupler configuration class allows reading and configuration of some important fieldbus/controller process parameters. The following listings explain in details all supported instances and attributes.

# **Instance 0 (Class Attributes)**

Table 194: Coupler/Controller configuration (64 hex) – Class

| Attribute ID | Access | Name         | Data type | Description              | Default value |
|--------------|--------|--------------|-----------|--------------------------|---------------|

| 1            | Get    | AipObj_Value            | ARRAY<br>of BYTE | Analog Input  | -                |
| 2            | Get    | AipObj_Value_<br>Length | USINT            | Length of the output data<br>AopObj_Value (in byte) | -                |

#### **Common Services**

Table 226: Analog Input Point Extended 1 (6B hex) - Common service

| Service | Service available |          | Service name         | Description                          |
|---------|-------------------|----------|----------------------|--------------------------------------|
| code    | Class             | Instance |                      |                                      |
| 0E hex  | Yes               | Yes      | Get_Attribute_Single | Supplies contents of the appropriate |
|         |                   |          |                      | attribute                            |

## 11.3.5.23 Analog Input Point Extended 2 (6F hex)

The extension of the "Analog Input Point" class enables the reading of data from a fieldbus node that contains over 510 analog outputs (AIPs). The instance scope of the "Analog Input Point Extended 2" class covers AIPs from 511 to 765 in the fieldbus node.

#### **Instance 0 (Class Attributes)**

Table 227: Analog Input Point Extended 2 (6F hex) – Class

| Attribute<br>ID | Access | Name         | Data type | Description              | Default<br>value |
|-----------------|--------|--------------|-----------|--------------------------|------------------|
| 1               | Get    | Revision     | UINT      | Revision of this object  | 1 (0x0001)       |
| 2               | Get    | Max Instance | UINT      | Max. number of instances | -                |

#### Instance 511 ... 765 (Analog Input 511 up to 765)

| Attribute<br>ID | Access | Name                    | Data type        | Description                                      | Default<br>value |
|-----------------|--------|-------------------------|------------------|--|------------------|
| 1               | Get    | AipObj_Value            | ARRAY<br>of BYTE | Analog Input                                     | -                |
| 2               | Get    | AipObj_Value_<br>Length | USINT            | Length of the output data AopObj_Value (in byte) | -                |

#### **Common Services**

Table 229: Analog Input Point Extended 2 (6F hex) – Common service

| Service | Service available |          | Service name         | Description                                    |
|---------|-------------------|----------|----------------------|--|
| code    | Class             | Instance |                      |  |
| 0E hex  | Yes               | Yes      | Get_Attribute_Single | Supplies contents of the appropriate attribute |

### 11.3.5.24 Analog Input Point Extended 3 (73 hex)

The extension of the "Analog Input Point" class enables the reading of data from a fieldbus node that contains over 765 analog outputs (AIPs). The instance scope of the "Analog Input Point Extended 3" class covers AIPs from 766 to 1020 in the fieldbus node.

#### **Instance 0 (Class Attributes)**

Table 230: Analog Input Point Extended 3 (73 hex) – Class

| Attribute<br>ID | Access | Name         | Data type | Description              | Default<br>value |
|-----------------|--------|--------------|-----------|--------------------------|------------------|
| 1               | Get    | Revision     | UINT      | Revision of this object  | 1 (0x0001)       |
| 2               | Get    | Max Instance | UINT      | Max. number of instances | -                |

#### **Instance 766 ... 1020 (Analog input value 766 up to 1020)**

Table 231: Analog Input Point Extended 3 (73 hex) – Instance 766 ... 1020

| Attribute ID | Access | Name                    | Data type        | Description                                      | Default<br>value |
|--------------|--------|-------------------------|------------------|--|------------------|
| 1            | Get    | AipObj_Value            | ARRAY<br>of BYTE | Analog Input                                     | -                |
| 2            | Get    | AipObj_Value_<br>Length | USINT            | Length of the output data AopObj_Value (in byte) | -                |

#### **Common Services**

Table 232: Analog Input Point Extended 3 (73 hex) – Common service

| Service | Service available |          | Service name         | Description                          |
|---------|-------------------|----------|----------------------|--------------------------------------|
| code    | Class             | Instance |                      |                                      |
| 0E hex  | Yes               | Yes      | Get_Attribute_Single | Supplies contents of the appropriate |
|         |                   |          |                      | attribute                            |

#### 11.3.5.25 Analog Output Point (68 hex)

This class enables the reading of data of a particular analog output point (AOP). An analog output point is part of an analog output module.

#### **Instance 0 (Class Attributes)**

Table 233: Analog Output Point (68 hex) – Class

| Attribute<br>ID | Access | Name         | Data type | Description              | Default<br>value |
|-----------------|--------|--------------|-----------|--------------------------|------------------|
| 1               | Get    | Revision     | UINT      | Revision of this object  | 1 (0x0001)       |
| 2               | Get    | Max Instance | UINT      | Max. number of instances | -                |

#### **Instance 1 ... 255 (Analog output value 1 up to 255)**

Table 234: Analog Output Point (68 hex) – Instance 1...255

| Attribute<br>ID | Access | Name                    | Data type        | Description                                      | Default<br>value |
|-----------------|--------|-------------------------|------------------|--|------------------|
| 1               | Get    | AopObj_Value            | ARRAY<br>of BYTE | Analog Output                                    | -                |
| 2               | Get    | AopObj_Value<br>_Length | USINT            | Length of the output data AopObj_Value (in byte) | -                |

#### **Common Services**

Table 235: Analog Output Point (68 hex) – Common service

| Service | Service available |          | Service name         | Description                                    |  |
|---------|-------------------|----------|----------------------|--|--|
| code    | Class             | Instance |                      |  |  |
| 0E hex  | Yes               | Yes      | Get_Attribute_Single | Supplies contents of the appropriate attribute |  |
| 10 hex  | No                | Yes      | Set_Attribute_Single | Modifies an attribute value                    |  |

## 11.3.5.26 Analog Output Point Extended 1 (6C hex)

The extension of the "Analog Output Point" class enables the exchange of data from a fieldbus node that contains over 255 analog output points (AOPs). The instance scope of the "Discrete Output Point Extended 1" class covers AOPs from 256 to 510 in the fieldbus node.

#### **Instance 0 (Class Attributes)**

Table 236: Analog Output Point Extended 1 (6C hex) - Class

| Attribute<br>ID | Access | Name         | Data type | Description              | Default<br>value |
|-----------------|--------|--------------|-----------|--------------------------|------------------|
| 1               | Get    | Revision     | UINT      | Revision of this object  | 1 (0x0001)       |
| 2               | Get    | Max Instance | UINT      | Max. number of instances | -                |

#### **Instance 256 ... 510 (Analog output value 256 up to 510)**

Table 237: Analog Output Point Extended 1 (6C hex) – Instance 256...510

| Attribute<br>ID | Access | Name                   | Data type        | Description                                      | Default<br>value |
|-----------------|--------|------------------------|------------------|--|------------------|
| 1               | Get    | AopObj_Value           | ARRAY<br>of BYTE | Analog Output                                    | -                |
| 2               | Get    | AopObj_Value<br>Length | USINT            | Length of the output data AopObj Value (in byte) | -                |

#### **Common Services**

Table 238: Analog Output Point Extended 1 (6C hex) – Common service

| Service | Service available |          | Service name         | Description                                    |  |

#### 12 I/O Modules

#### 12.1 **Overview**

For modular applications with the WAGO-I/O-SYSTEM 750/753, different types of I/O modules are available

- Digital Input Modules
- Digital Output Modules
- **Analog Input Modules**
- **Analog Output Modules**
- Specialty Modules
- System Modules

For detailed information on the I/O modules and the module variations, refer to the manuals for the I/O modules.

You will find these manuals on the WAGO web pages under www.wago.com.

# Information

#### More Information about the WAGO-I/O-SYSTEM

Current information on the modular WAGO-I/O-SYSTEM is available in the Internet under: www.wago.com.

### 12.2 Process Data Architecture for MODBUS/TCP

With some I/O modules, the structure of the process data is field bus specific.

MODBUS/TCP process image uses a word structure (with word alignment). The internal mapping method for data greater than one byte conforms to the Intel format.

The following section describes the process image for various WAGO-I/O-SYSTEM 750 and 753 I/O modules with MODBUS/TCP.

# NOTICE

#### Equipment damage due to incorrect address!

Depending on the specific position of an I/O module in the fieldbus node, the process data of all previous byte or bit-oriented modules must be taken into account to determine its location in the process data map.

## 12.2.1 Digital Input Modules

Digital input modules supply one bit of data per channel to specify the signal state for the corresponding channel. These bits are mapped into the Input Process Image.

Some digital modules have an additional diagnostic bit per channel in the Input Process Image. The diagnostic bit is used for detecting faults that occur (e.g., wire breaks and/or short circuits).

When analog input modules are also present in the node, the digital data is always appended after the analog data in the Input Process Image, grouped into bytes.

#### 12.2.1.4 2 Channel Digital Input Module with Diagnostics and Output Process Data

750-418, 753-418

The digital input module supplies a diagnostic and acknowledge bit for each input channel. If a fault condition occurs, the diagnostic bit is set. After the fault condition is cleared, an acknowledge bit must be set to re-activate the input. The diagnostic data and input data bit is mapped in the Input Process Image, while the acknowledge bit is in the Output Process Image.

Table 254: 2 Channel Digital Input Module with Diagnostics and Output Process Data

| Input Process Image |       |       |       |            |            |           |           |  |  |  |

# 12.2.1.7 8 Channel Digital Input Module PTC with Diagnostics and Output Process Data

750-1425

The digital input module PTC provides via one logical channel 2 byte for the input and output process image.

The signal state of PTC inputs DI1 ... DI8 is transmitted to the fieldbus coupler/controller via input data byte D0.

The fault conditions are transmitted via input data byte D1.

The channels 1 ... 8 are switched on or off via the output data byte D1. The output data byte D0 is reserved and always has the value "0".

Table 257: 8 Channel Digital Input Module PTC with Diagnostics and Output Process Data

| Input          | nput Process Image                         |                |  |                |                         |  |                |                  |                                |                  |                                |                                |                       |                  |                                |

### 12.2.2 Digital Output Modules

Digital output modules use one bit of data per channel to control the output of the corresponding channel. These bits are mapped into the Output Process Image.

Some digital modules have an additional diagnostic bit per channel in the Input Process Image. The diagnostic bit is used for detecting faults that occur (e.g., wire breaks and/or short circuits). For modules with diagnostic bit is set, also the data bits have to be evaluated.

When analog output modules are also present in the node, the digital image data is always appended after the analog data in the Output Process Image, grouped into bytes.

#### 12.2.2.1 1 Channel Digital Output Module with Input Process Data

750-523

The digital output modules deliver 1 bit via a process value Bit in the output process image, which is illustrated in the input process image. This status image shows "manual mode".

Table 259: 1 Channel Digital Output Module with Input Process Data

# 12.2.2.3 2 Channel Digital Input Modules with Diagnostics and Input Process Data

750-507 (-508), -522, 753-507

The digital output modules have a diagnostic bit for each output channel. When an output fault condition occurs (i.e., overload, short circuit, or broken wire), a diagnostic bit is set. The diagnostic data is mapped into the Input Process Image, while the output control bits are in the Output Process Image.

Table 261: 2 Channel Digital Input Modules with Diagnostics and Input Process Data

| <b>Input Proc</b> | ess Image |       |       |       |       |                                    |                                    |

|                   |                      |       |       |       |       | controls  | controls  |  |  |  |  |
|                   |                      |       |       |       |       | DO 2      | DO 1      |  |  |  |  |
|                   |                      |       |       |       |       | Channel 2 | Channel 1 |  |  |  |  |

750-506, 753-506

The digital output module has 2-bits of diagnostic information for each output channel. The 2-bit diagnostic information can then be decoded to determine the exact fault condition of the module (i.e., overload, a short circuit, or a broken wire). The 4-bits of diagnostic data are mapped into the Input Process Image, while the output control bits are in the Output Process Image.

#### 12.2.3 **Analog Input Modules**

The hardware of an analog input module has 16 bits of measured analog data per channel and 8 bits of control/status.

However, the coupler/controller with MODBUS/TCP does not have access to the 8 control/status bits.

Therefore, the coupler/controller with MODBUS/TCP can only access the 16 bits of analog data per channel, which are grouped as words and mapped in Intel format in the Input Process Image.

When digital input modules are also present in the node, the analog input data is always mapped into the Input Process Image in front of the digital data.

# Information

### Information on the structure of control and status bytes

For detailed information on the structure of a particular I/O module's control/status bytes, please refer to that module's manual. Manuals for each module can be found on the Internet at www.wago.com.

## 12.2.3.5 8 Channel Analog Input Modules

750-451

Table 273: 8 Channel Analog Input Modules

| Input Process Image |                  |          |                          |
|---------------------|------------------|----------|--------------------------|
| Officet             | Byte Destination |          | Description              |
| Offset              | High Byte        | Low Byte | Description              |
| 0                   | D1               | D0       | Measured Value Channel 1 |
| 1                   | D3               | D2       | Measured Value Channel 2 |
| 2                   | D5               | D4       | Measured Value Channel 3 |
| 3                   | D7               | D6       | Measured Value Channel 4 |
| 4                   | D9               | D8       | Measured Value Channel 5 |
| 5                   | D11              | D10      | Measured Value Channel 6 |
| 6                   | D13              | D12      | Measured Value Channel 7 |
| 7                   | D15              | D14      | Measured Value Channel 8 |

#### 12.2.4 **Analog Output Modules**

The hardware of an analog output module has 16 bits of measured analog data per channel and 8 bits of control/status. However, the coupler/controller with MODBUS/TCP does not have access to the 8 control/status bits. Therefore, the coupler/controller with MODBUS/TCP can only access the 16 bits of analog data per channel, which are grouped as words and mapped in Intel format in the Output Process Image.

When digital output modules are also present in the node, the analog output data is always mapped into the Output Process Image in front of the digital data.

# Information

### Information on the structure of control and status bytes

For detailed information on the structure of a particular I/O module's control/status bytes, please refer to that module's manual. Manuals for each module can be found on the Internet at www.wago.com.

#### 12.2.4.1 2 Channel Analog Output Modules

## 12.2.5 Specialty Modules

WAGO has a host of Specialty I/O modules that perform various functions. With individual modules beside the data bytes also the control/status byte is mapped in the process image.

The control/status byte is required for the bidirectional data exchange of the module with the higher-ranking control system. The control byte is transmitted from the control system to the module and the status byte from the module to the control system.

This allows, for example, setting of a counter with the control byte or displaying of overshooting or undershooting of the range with the status byte.

The control/status byte always is in the process image in the Low byte.

# Information

#### Information to the structure of the Control/Status byte

For detailed information about the structure of a particular module's control/status byte, please refer to that module's manual. Manuals for each module can be found on the Internet under: <a href="www.wago.com">www.wago.com</a>.

#### 12.2.5.1 Counter Modules

750-404, (and all variations except of /000-005), 753-404, (and variation /000-003)

The above Counter Modules have a total of 5 bytes of user data in both the Input and Output Process Image (4 bytes of counter data and 1 byte of control/status). The counter value is supplied as 32 bits. The following tables illustrate the Input and Output Process Image, which has a total of 3 words mapped into each image. Word alignment is applied.

Table 277: Counter Modules 750-404, (and all variations except of /000-005), 753-404, (and variation /000-003)

| Input Process Image |           |           |                              |  |
|---------------------|-----------|-----------|------------------------------|--|
| Offerst             | Byte De   | stination | Description                  |  |
| Offset              | High Byte | Low Byte  | Description                  |  |
| 0                   | -         | S         | Status byte                  |  |
| 1                   | D1        | D0        | Communication and the second |  |
| 2                   | D3        | D2        | Counter value                |  |

| Output | Output Process Image |           |                         |  |  |  |
|--------|----------------------|-----------|-------------------------|--|--|--|

#### 12.2.5.2 Pulse Width Modules

750-511, (and all variations /xxx-xxx)

The above Pulse Width modules have a total of 6 bytes of user data in both the Input and Output Process Image (4 bytes of channel data and 2 bytes of control/status). The two channel values are supplied as 16 bits. Each channel has its own control/status byte. The following table illustrates the Input and Output Process Image, which has a total of 4 words mapped into each image. Word alignment is applied.

Table 280: Pulse Width Modules 750-511, /xxx-xxx

| Input and Output Process |           |                  |                                  |  |
|--------------------------|-----------|------------------|----------------------------------|--|
| Offerst                  | Byte De   | Byte Destination |                                  |  |
| Offset                   | High Byte | Low Byte         | Description                      |  |
| 0                        | -         | C0/S0            | Control/Status byte of Channel 1 |  |
| 1                        | D1        | D0               | Data Value of Channel 1          |  |
| 2                        | -         | C1/S1            | Control/Status byte of Channel 2 |  |
| 3                        | D3        | D2               | Data Value of Channel 2          |  |

#### 12.2.5.3 Serial Interface Modules with alternative Data Format

750-650, (and the variations /000-002, -004, -006, -009, -010, -011, -012, -013), 750-651, (and the variations /000-001, -002, -003), 750-653, (and the variations /000-002, -007), 753-650, -653

## Note

# The process image of the / 003-000-variants depends on the parameterized operating mode!

With the freely parameterizable variations /003 000 of the serial interface modules, the desired operation mode can be set. Dependent on it, the process image of these modules is then the same, as from the appropriate variation.

The above Serial Interface Modules with alternative data format have a total of 4 bytes of user data in both the Input and Output Process Image (3 bytes of serial data and 1 byte of control/status). The following table illustrates the Input and Output Process Image, which have a total of 2 words mapped into each image. Word alignment is applied.

Table 281: Serial Interface Modules with alternative Data Format

| Input and Output Process Image      |           |          |           |                        |  |
|-------------------------------------|-----------|----------|-----------|------------------------|--|
| Offset Byte Destination Description |           |          |           |                        |  |
| Oliset                              | High Byte | Low Byte | Descr     | aption                 |  |
| 0                                   | D0        | C/S      | Data byte | Control/status<br>byte |  |
| 1                                   | D2        | D1       | Data      | bytes                  |  |

#### 12.2.5.4 Serial Interface Modules with Standard Data Format

750-650/000-001, -014, -015, -016 750-653/000-001, -006

The above Serial Interface Modules with Standard Data Format have a total of 6 bytes of user data in both the Input and Output Process Image (5 bytes of serial data and 1 byte of control/status). The following table illustrates the Input and Output Process Image, which have a total of 3 words mapped into each image. Word alignment is applied.

Table 282: Serial Interface Modules with Standard Data Format

| Input and Output Process Image |           |                  |             |                        |
|--------------------------------|-----------|------------------|-------------|------------------------|
| Official                       | Byte De   | Byte Destination |             | .:4:                   |
| Offset                         | High Byte | Low Byte         | Description |                        |
| 0                              | D0        | C/S              | Data byte   | Control/status<br>byte |
| 1                              | D2        | D1               | Data bytes  |                        |
| 2                              | D4        | D3               |             |                        |

#### 12.2.5.5 Data Exchange Module

750-654, (and the variation /000-001)

The Data Exchange modules have a total of 4 bytes of user data in both the Input and Output Process Image. The following tables illustrate the Input and Output

Process Image, which has a total of 2 words mapped into each image. Word alignment is applied.

Table 283: Data Exchange Module

| Input ar | Input and Output Process Image |           |             |  |  |  |
|----------|--------------------------------|-----------|-------------|--|--|--|
| Offact   | Byte Des                       | stination | Description |  |  |  |
| Offset   | High Byte                      | Low Byte  | Description |  |  |  |
| 0        | D1                             | D0        | Detalentes  |  |  |  |
| 1        | D3                             | D2        | Data bytes  |  |  |  |

#### 12.2.5.6 SSI Transmitter Interface Modules

750-630 (and all variations)

# Note

# The process image of the / 003-000-variants depends on the parameterized operating mode!

The operating mode of the configurable /003-000 I/O module versions can be set. Based on the operating mode, the process image of these I/O modules is then the same as that of the respective version.

The above SSI Transmitter Interface modules have a total of 4 bytes of user data in the Input Process Image, which has 2 words mapped into the image. Word alignment is applied.

Table 284: SSI Transmitter Interface Modules

| Input Process Image |           |           |             |  |
|---------------------|-----------|-----------|-------------|--|
| Officet             | Byte Des  | stination | Description |  |
| Offset              | High Byte | Low Byte  | Description |  |
| 0                   | D1        | D0        | D-4-1-4     |  |
| 1                   | D3        | D2        | Data bytes  |  |

#### 12.2.5.7 Incremental Encoder Interface Modules

750-631/000-004, -010, -011

The above Incremental Encoder Interface modules have 5 bytes of input data and 3 bytes of output data. The following tables illustrate the Input and Output Process Image, which have 4 words into each image. Word alignment is applied.

Table 285: Incremental Encoder Interface Modules 750-631/000-004, --010, -011

| Input Process Image |           |          |                      |            |  |
|---------------------|-----------|----------|----------------------|------------|--|
| Offeet              | Dagar     |          |                      |            |  |
| Offset              | High Byte | Low Byte | Description          |            |  |
| 0                   | -         | S        | not used Status byte |            |  |
| 1                   | D1        | D0       | Counter word         |            |  |
| 2                   | -         | -        | not used             |            |  |
| 3                   | D4        | D3       | Latch                | Latch word |  |

| Output Process Image |           |             |                       |  |  |
|----------------------|-----------|-------------|-----------------------|--|--|
| Official             | Dagas     | Description |                       |  |  |
| Offset               | High Byte | Low Byte    | Description           |  |  |
| 0                    | -         | С           | not used Control byte |  |  |
| 1                    | D1        | D0          | Counter setting word  |  |  |
| 2                    | -         | -           | not used              |  |  |
| 3                    | -         | -           | not used              |  |  |

#### 750-634

The above Incremental Encoder Interface module has 5 bytes of input data (6 bytes in cycle duration measurement mode) and 3 bytes of output data. The following tables illustrate the Input and Output Process Image, which has 4 words mapped into each image. Word alignment is applied.

Table 286: Incremental Encoder Interface Modules 750-634

| Input Process Image |              |           |                      |                 |  |
|---------------------|--------------|-----------|----------------------|-----------------|--|
| Official            | Byte De      | stination | Dagas                | .:4:            |  |
| Offset              | High Byte    | Low Byte  | Description          |                 |  |
| 0                   | -            | S         | not used Status byte |                 |  |
| 1                   | D1           | D0        | Count                | Counter word    |  |
| 2                   | <del>-</del> | (D2) *)   | not used             | (Periodic time) |  |
| 3                   | D4           | D3        | Latch word           |                 |  |

If cycle duration measurement mode is enabled in the control byte, the cycle duration is \*) given as a 24-bit value that is stored in D2 together with D3/D4.

| Output Process Image |           |          |                       |  |  |
|----------------------|-----------|----------|-----------------------|--|--|
| Official             | Byte Des  | Dagas    | ···· 4: - ··          |  |  |
| Offset               | High Byte | Low Byte | Description           |  |  |
| 0                    | -         | C        | not used Control byte |  |  |
| 1                    | D1        | D0       | Counter setting word  |  |  |
| 2                    | -         | -        | not used              |  |  |
| 3                    | -         | -        |                       |  |  |

#### 750-637

The above Incremental Encoder Interface Module has a total of 6 bytes of user data in both the Input and Output Process Image (4 bytes of encoder data and 2 bytes of control/status). The following table illustrates the Input and Output Process Image, which have 4 words mapped into each image. Word alignment is applied.

| Input and Output Process Image |           |            |                                  |  |  |
|--------------------------------|-----------|------------|----------------------------------|--|--|
| Official                       | Byte De   | estination | Description                      |  |  |
| Offset                         | High Byte | Low Byte   | Description                      |  |  |
| 0                              | -         | C0/S0      | Control/Status byte of Channel 1 |  |  |
| 1                              | D1        | D0         | Data Value of Channel 1          |  |  |
| 2                              | -         | C1/S1      | Control/Status byte of Channel 2 |  |  |
| 3                              | D3        | D2         | Data Value of Channel 2          |  |  |

Table 287: Incremental Encoder Interface Modules 750-637

750-635, 753-635

The above Digital Pulse Interface module has a total of 4 bytes of user data in both the Input and Output Process Image (3 bytes of module data and 1 byte of control/status). The following table illustrates the Input and Output Process Image, which have 2 words mapped into each image. Word alignment is applied.

Table 288: Digital Pulse Interface Modules 750-635

| Input a | Input and Output Process Image |          |             |                        |  |
|---------|--------------------------------|----------|-------------|------------------------|--|
| Offset  | Byte Destination Description   |          |             |                        |  |
| Offset  | High Byte                      | Low Byte | Description |                        |  |
| 0       | D0                             | C0/S0    | Data byte   | Control/status<br>byte |  |
| 1       | D2                             | D1       | Data bytes  |                        |  |

#### 12.2.5.8 **DC-Drive Controller**

750-636

The DC-Drive Controller maps 6 bytes into both the input and output process image. The data sent and received are stored in up to 4 input and output bytes (D0 ... D3). Two control bytes (C0, C1) and two status bytes (S0/S1) are used to control the I/O module and the drive.

In addition to the position data in the input process image (D0 ... D3), it is possible to display extended status information (S2 ... S5). Then the three control bytes (C1 ... C3) and status bytes (S1 ... S3) are used to control the data flow.

Bit 3 of control byte C1 (C1.3) is used to switch between the process data and the extended status bytes in the input process image (Extended Info ON). Bit 3 of status byte S1 (S1.3) is used to acknowledge the switching process.

Table 289: DC-Drive Controller 750-636

| Input Process Image |             |          |             |  |
|---------------------|-------------|----------|-------------|--|
| Offset              | Description |          |             |  |
| Oliset              | High Byte   | Low Byte | Description |  |

| 0 | S1           | S0           | Status byte S1  | Status byte S0                                     |
|---|--------------|--------------|---|--|
| 1 | D1*) / S3**) | D0*) / S2**) |   | Actual position (LSB) / Extended status byte S2**) |
| 2 | D3*) / S5**) | D2*) / S4**) | Actual position<br>(MSB) /<br>Extended status<br>byte S3**) | Actual position*) / Extended status byte S4**)     |

ExtendedInfo ON = '0'.

<sup>\*\*)</sup> ExtendedInfo $_ON = '1'$ .

| Output | Output Process Image |             |                         |                         |  |  |
|--------|----------------------|-------------|-------------------------|-------------------------|--|--|
| Offact | Byte I               | Destination | Description             |                         |  |  |
| Offset | High Byte            | Low Byte    | Descr                   | aption                  |  |  |
| 0      | C1                   | C0          | Control byte C1         | Control byte C0         |  |  |
| 1      | D1                   | D0          | Setpoint position       | Setpoint position (LSB) |  |  |
| 2      | D3                   | D2          | Setpoint position (MSB) | Setpoint position       |  |  |

#### 12.2.5.9 **Stepper Controller**

750-670

The Stepper controller RS422 / 24 V / 20 mA 750-670 provides the fieldbus coupler 12 bytes input and output process image via 1 logical channel. The data to be sent and received are stored in up to 7 output bytes (D0 ... D6) and 7 input bytes (D0 ... D6), depending on the operating mode.

Output byte D0 and input byte D0 are reserved and have no function assigned.

One I/O module control and status byte (C0, S0) and 3 application control and status bytes (C1 ... C3, S1 ... S3) provide the control of the data flow.

Switching between the two process images is conducted through bit 5 in the control byte (C0 (C0.5). Activation of the mailbox is acknowledged by bit 5 of the status byte S0 (S0.5).

Table 290: Stepper Controller RS 422 / 24 V / 20 mA 750-670

| Input Process Image |           |            |                             |                              |  |
|---------------------|-----------|------------|-----------------------------|------------------------------|--|

#### 12.2.5.10 RTC Module

750-640

The RTC Module has a total of 6 bytes of user data in both the Input and Output Process Image (4 bytes of module data and 1 byte of control/status and 1 byte ID for command). The following table illustrates the Input and Output Process Image, which have 3 words mapped into each image. Word alignment is applied.

Table 291: RTC Module 750-640

| Input and Output Process Image |                  |          |              |                        |  |
|--------------------------------|------------------|----------|--------------|------------------------|--|

#### 12.2.5.12 DALI Multi-Master Module

753-647

The DALI Multi-Master module occupies a total of 24 bytes in the input and output range of the process image.

The DALI Multi-Master module can be operated in "Easy" mode (default) and "Full" mode. "Easy" mode is used to transmit simply binary signals for lighting control. Configuration or programming via DALI master module is unnecessary in "Easy" mode.

Changes to individual bits of the process image are converted directly into DALI commands for a pre-configured DALI network. 22 bytes of the 24-byte process image can be used directly for switching of electronic ballasts (ECG), groups or scenes in "Easy" mode. Switching commands are transmitted via DALI and group addresses, where each DALI and each group address is represented by a 2-bit pair.

The structure of the process data is described in detail in the following tables.

Table 293: Overview of Input Process Image in the "Easy" Mode

| Input p  | Input process image |           |   |  |  |  |
|----------|---------------------|-----------|---|--|--|--|

DA = DALI address

GA = Group address

## 12.2.5.13 LON® FTT Module

753-648

The process image of the LON® FTT module consists of a control/status byte and 23 bytes of bidirectional communication data that is processed by the WAGO-I/O-PRO function block "LON\_01.lib". This function block is essential for the function of the LON® FTT module and provides a user interface on the control side.

### 12.2.5.14 EnOcean Radio Receiver

750-642

The EnOcean radio receiver has a total of 4 bytes of user data in both the Input and Output Process Image (3 bytes of module data and 1 byte of control/status). The following tables illustrate the Input and Output Process Image, which have 2 words mapped into each image. Word alignment is applied.

Table 295: EnOcean Radio Receiver 750-642

| Input Process Image                 |           |          |                       |  |  |  |  |  |

## 12.2.5.15 MP Bus Master Module

750-643

The MP Bus Master Module has a total of 8 bytes of user data in both the Input and Output Process Image (6 bytes of module data and 2 bytes of control/status). The following table illustrates the Input and Output Process Image, which have 4 words mapped into each image. Word alignment is applied.

| Input a | Input and Output Process Image |            |  |         |  |  |  |  |  |
|---------|--------------------------------|------------|--|---------|--|--|--|--|--|

| 3       | D5                             | D4         |  |         |  |  |  |  |  |

Table 296: MP Bus Master Module 750-643

## 12.2.5.16 Bluetooth® RF-Transceiver

750-644

The size of the process image for the *Bluetooth*® module can be adjusted to 12, 24 or 48 bytes.

It consists of a control byte (input) or status byte (output); an empty byte; an overlay able mailbox with a size of 6, 12 or 18 bytes (mode 2); and the *Bluetooth*® process data with a size of 4 to 46 bytes.

Thus, each *Bluetooth*® module uses between 12 and 48 bytes in the process image. The sizes of the input and output process images are always the same.

The first byte contains the control/status byte; the second contains an empty byte.

Process data attach to this directly when the mailbox is hidden. When the mailbox is visible, the first 6, 12 or 18 bytes of process data are overlaid by the mailbox data, depending on their size. Bytes in the area behind the optionally visible mailbox contain basic process data. The internal structure of the *Bluetooth*® process data can be found in the documentation for the *Bluetooth*® 750-644 RF Transceiver.

The mailbox and the process image sizes are set with the startup tool WAGO-I/O-CHECK.

Table 297: Bluetooth® RF-Transceiver 750-644

| Input and Output Process Image |           |            |                              |   |  |  |  |  |

### 12.2.5.18 AS-interface Master Module

750-655

The length of the process image of the AS-interface master module can be set to fixed sizes of 12, 20, 24, 32, 40 or 48 bytes.

It consists of a control or status byte, a mailbox with a size of 0, 6, 10, 12 or 18 bytes and the AS-interface process data, which can range from 0 to 32 bytes.

The AS-interface master module has a total of 6 to maximally 24 words data in both the Input and Output Process Image. Word alignment is applied.

The first Input and output word, which is assigned to an AS-interface master module, contains the status / control byte and one empty byte. Subsequently the mailbox data are mapped, when the mailbox is permanently superimposed (Mode 1).

In the operating mode with suppressible mailbox (Mode 2), the mailbox and the cyclical process data are mapped next.

The following words contain the remaining process dat.

The mailbox and the process image sizes are set with the startup tool WAGO-I/O-*CHECK*.

Table 299: AS-interface Master Module 750-655

| Input and Output Process Image |           |            |                              |                           |  |  |  |  |

#### 12.2.6 **System Modules**

#### 12.2.6.1 **System Modules with Diagnostics**

750-610, -611

The modules provide 2 bits of diagnostics in the Input Process Image for monitoring of the internal power supply.

Table 300: System Modules with Diagnostics 750-610, -611

| <b>Input Proc</b> | Input Process Image |       |       |       |       |            |            |  |  |  |
|-------------------|---------------------|-------|-------|-------|-------|------------|------------|--|--|--|
| Bit 7             | Bit 6               | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1      | Bit 0      |  |  |  |

#### 12.2.6.2 **Binary Space Module**

750-622

The Binary Space Modules behave alternatively like 2 channel digital input modules or output modules and seize depending upon the selected settings 1, 2, 3 or 4 bits per channel. According to this, 2, 4, 6 or 8 bits are occupied then either in the process input or the process output image.

Table 301: Binary Space Module 750-622 (with Behavior Like 2 Channel Digital Input)

| Input and ( | Input and Output Process Image |           |           |           |           |          |          |  |  |
|-------------|--------------------------------|-----------|-----------|-----------|-----------|----------|----------|--|--|

## 12.3 Process Data Architecture for EtherNet/IP

With some I/O modules, the structure of the process data is fieldbus specific.

In the case of a fieldbus controller with EtherNet/IP, the process image uses a word structure (with word alignment). The internal mapping method for data greater than one byte conforms to the Intel format.

The following section describes the process image for various WAGO-I/O-SYSTEM 750 and 753 I/O modules when using a fieldbus coupler with EtherNet/IP.

## NOTICE

## Equipment damage due to incorrect address!

Depending on the specific position of an I/O module in the fieldbus node, the process data of all previous byte or bit-oriented modules must be taken into account to determine its location in the process data map.

#### 12.3.1 **Digital Input Modules**

Digital input modules supply one bit of data per channel to specify the signal state for the corresponding channel. These bits are mapped into the Input Process Image.

Some digital I/O modules have an additional diagnostic bit per channel in the input process image. The diagnostic bit detects faults (e.g., wire breakage, overloads and/or short circuits). For some I/O modules, the data bits also have be evaluated with the set diagnostic bit.

When analog input modules are also present in the node, the digital data is always appended after the analog data in the Input Process Image, grouped into bytes.

1 sub index is assigned for each 8 bit.

Each input channel seizes one Instance in the Discrete Input Point Object (Class 0x65).

#### 12.3.1.1 1 Channel Digital Input Module with Diagnostics

750-435

Table 302: 1 Channel Digital Input Module with Diagnostics

| <b>Input Proc</b> | Input Process Image |       |       |       |       |                          |                  |  |  |  |

|                     |       |       |       | bit S 2    | bit S 1    | DI 2      | DI 1      |  |  |
|                     |       |       |       | Channel 2  | Channel 1  | Channel 2 | Channel 1 |  |  |

The input modules seize 4 Instances in Class (0x65).

# 12.3.1.4 2 Channel Digital Input Module with Diagnostics and Output Process Data

750-418, 753-418

The digital input module supplies a diagnostic and acknowledge bit for each input channel. If a fault condition occurs, the diagnostic bit is set. After the fault condition is cleared, an acknowledge bit must be set to re-activate the input. The diagnostic data and input data bit is mapped in the Input Process Image, while the acknowledge bit is in the Output Process Image.

Table 305: 2 Channel Digital Input Module with Diagnostics and Output Process Data

| Input Process Image |       |       |       |            |            |           |           |  |  |
|---------------------|-------|-------|-------|------------|------------|-----------|-----------|--|--|
| Bit 7               | Bit 6 | Bit 5 | Bit 4 | Bit 3      | Bit 2      | Bit 1     | Bit 0     |  |  |
|                     |       |       |       | Diagnostic | Diagnostic | Data bit  | Data bit  |  |  |
|                     |       |       |       | bit S 2    | bit S 1    | DI 2      | DI 1      |  |  |
|                     |       |       |       | Channel 2  | Channel 1  | Channel 2 | Channel 1 |  |  |

The input modules seize 4 Instances in Class (0x65).

| Output Process Image |       |       |       |              |              |       |       |  |  |  |  |

## 12.3.2 Digital Output Modules

Digital output modules use one bit of data per channel to control the output of the corresponding channel. These bits are mapped into the Output Process Image.

Some digital modules have an additional diagnostic bit per channel in the Input Process Image. The diagnostic bit is used for detecting faults that occur (e.g., wire breaks and/or short circuits). With some I/O modules, with set diagnostic bit, additionally the data bits must be evaluated.

When analog output modules are also present in the node, the digital image data is always appended after the analog data in the Output Process Image, grouped into bytes.

For each 8 bits a subindex is occupied.

Each output channel occupies one instance in the Discrete Output Point Object (Class 0x 66).

## 12.3.2.1 1 Channel Digital Output Module with Input Process Data

750-523

The digital output modules deliver 1 bit via a process value Bit in the output process image, which is illustrated in the input process image. This status image shows "manual mode".

Table 309: 1 Channel Digital Output Module with Input Process Data

| Input Process Image |       |       |       |       |       |          |                               |  |  |  |  |

And the output modules seize 2 Instances in Class (0x66).

## 12.3.2.2 2 Channel Digital Output Modules

750-501, -502, -509, -512, -513, -514, -517, -535, (and all variations), 753-501, -502, -509, -512, -513, -514, -517

Table 310: 2 Channel Digital Output Modules

| Output Pr | Output Process Image |       |       |       |       |           |           |  |  |  |  |  |
|-----------|----------------------|-------|-------|-------|-------|-----------|-----------|--|--|--|--|--|
| Bit 7     | Bit 6                | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1     | Bit 0     |  |  |  |  |  |
|           |                      |       |       |       |       | controls  | controls  |  |  |  |  |  |
|           |                      |       |       |       |       | DO 2      | DO 1      |  |  |  |  |  |
|           |                      |       |       |       |       | Channel 2 | Channel 1 |  |  |  |  |  |

The output modules seize 2 Instances in Class (0x66).

# 12.3.2.3 2 Channel Digital Input Modules with Diagnostics and Input Process Data

750-507 (-508), -522, 753-507

The digital output modules have a diagnostic bit for each output channel. When an output fault condition occurs (i.e., overload, short circuit, or broken wire), a diagnostic bit is set. The diagnostic data is mapped into the Input Process Image, while the output control bits are in the Output Process Image.

Table 311: 2 Channel Digital Input Modules with Diagnostics and Input Process Data

| <b>Input Proc</b> | Input Process Image |       |       |       |       |                                    |                                    |  |  |  |  |  |
|-------------------|---------------------|-------|-------|-------|-------|------------------------------------|------------------------------------|--|--|--|--|--|

|                      |       |       |       |       |       | controls  | controls  |  |  |  |  |
|                      |       |       |       |       |       | DO 2      | DO 1      |  |  |  |  |
|                      |       |       |       |       |       | Channel 2 | Channel 1 |  |  |  |  |

And the output modules seize 2 Instances in Class (0x66).

750-506, 753-506

The digital output module has 2-bits of diagnostic information for each output channel. The 2-bit diagnostic information can then be decoded to determine the exact fault condition of the module (i.e., overload, a short circuit, or a broken wire). The 4-bits of diagnostic data are mapped into the Input Process Image, while the output control bits are in the Output Process Image.

Table 312: 2 Channel Digital Input Modules with Diagnostics and Input Process Data 75x-506

| <b>Input Proc</b> | ess Image |       |       |            |            |            |            |

The output modules seize 16 Instances in Class (0x66).

## 12.3.2.9 8 Channel Digital Input/Output Modules

750-1502, -1506

Table 318: 8 Channel Digital Input/Output Modules

| <b>Input Proc</b> | Input Process Image |           |           |           |           |           |           |  |  |
|-------------------|---------------------|-----------|-----------|-----------|-----------|-----------|-----------|--|--|
| Bit 7             | Bit 6               | Bit 5     | Bit 4     | Bit 3     | Bit 2     | Bit 1     | Bit 0     |  |  |
| Data bit          | Data bit            | Data bit  | Data bit  | Data bit  | Data bit  | Data bit  | Data bit  |  |  |
| DI 8              | DI 7                | DI 6      | DI 5      | DI 4      | DI 3      | DI 2      | DI 1      |  |  |
| Channel 8         | Channel 7           | Channel 6 | Channel 5 | Channel 4 | Channel 3 | Channel 2 | Channel 1 |  |  |

The input/output modules seize 8 Instances in Class (0x65).

| <b>Output Pr</b> | Output Process Image |           |           |           |           |           |           |  |  |
|------------------|----------------------|-----------|-----------|-----------|-----------|-----------|-----------|--|--|
| Bit 7            | Bit 6                | Bit 5     | Bit 4     | Bit 3     | Bit 2     | Bit 1     | Bit 0     |  |  |
| controls         | controls             | controls  | controls  | controls  | controls  | controls  | controls  |  |  |
| DO 8             | DO 7                 | DO 6      | DO 5      | DO 4      | DO 3      | DO 2      | DO 1      |  |  |
| Channel 8        | Channel 7            | Channel 6 | Channel 5 | Channel 4 | Channel 3 | Channel 2 | Channel 1 |  |  |

The input/output modules seize 8 Instances in Class (0x66).

#### 12.3.3 **Analog Input Modules**

The hardware of an analog input module has 16 bits of measured analog data per channel and 8 bits of control/status.

However, the coupler/controller with EtherNet/IP does not have access to the 8 control/status bits.

Therefore, the coupler/controller with MODBUS/TCP can only access the 16 bits of analog data per channel, which are grouped as words and mapped in Intel format in the Input Process Image.

When digital input modules are also present in the node, the analog input data is always mapped into the Input Process Image in front of the digital data.

Each input channel seizes one Instance in the Analog Input Point Object (Class 0x67).

## Note

## Information for the control/status byte development

Please refer to the corresponding description of the I/O modules for the structure of the control/status bytes. You can find a manual with the relevant I/O module description on the WAGO home page: at: http://www.wago.com.

#### 12.3.3.1 1 Channel Analog Input Modules

750-491, (and all variations)

Table 319: 1 Channel Analog Input Modules

| Input Process Image |           |             |                                 |  |  |  |  |  |
|---------------------|-----------|-------------|---------------------------------|--|--|--|--|--|
| Tarakamaa           | Byte D    | Description |                                 |  |  |  |  |  |
| Instance            | High Byte | Low Byte    | Description                     |  |  |  |  |  |
| n                   | D1        | D0          | Measured Value U <sub>D</sub>   |  |  |  |  |  |
| n+1                 | D3        | D2          | Measured Value U <sub>ref</sub> |  |  |  |  |  |

The input modules represent 2x2 bytes and seize 2 Instances in Class (0x67).

## 12.3.3.2 2 Channel Analog Input Modules

750-452, -454, -456, -461, -462, -465, -466, -467, -469, -472, -474, -475, 476, -477, -478, -479, -480, -481, -483, -485, -492, (and all variations), 753-452, -454, -456, -461, -465, -466, -467, -469, -472, -474, -475, 476, -477, 478, -479, -483, -492, (and all variations)

Table 320: 2 Channel Analog Input Modules

| Input Process Image |           |             |                          |  |  |  |  |  |
|---------------------|-----------|-------------|--------------------------|--|--|--|--|--|
| Instance            | Byte I    | Destination | Description              |  |  |  |  |  |
| Instance            | High Byte | Low Byte    | Description              |  |  |  |  |  |
| n                   | D1        | D0          | Measured Value Channel 1 |  |  |  |  |  |
| n+1                 | D3        | D2          | Measured Value Channel 2 |  |  |  |  |  |

The input modules represent 2x2 bytes and seize 2 Instances in Class (0x67).

## 12.3.3.3 4 Channel Analog Input Modules

750-453, -455, -457, -459, -460, -468, (and all variations), 753-453, -455, -457, -459

Table 321: 4 Channel Analog Input Modules

| Input Proce | Input Process Image |             |                          |  |  |  |  |  |  |
|-------------|---------------------|-------------|--------------------------|--|--|--|--|--|--|
| Instance    | Byte I              | Destination | Description              |  |  |  |  |  |  |
| Ilistance   | High Byte           | Low Byte    | Description              |  |  |  |  |  |  |
| n           | D1                  | D0          | Measured Value Channel 1 |  |  |  |  |  |  |
| n+1         | D3                  | D2          | Measured Value Channel 2 |  |  |  |  |  |  |
| n+2         | D5                  | D4          | Measured Value Channel 3 |  |  |  |  |  |  |
| n+3         | D7                  | D6          | Measured Value Channel 4 |  |  |  |  |  |  |

The input modules represent 4x2 bytes and seize 4 Instances in Class (0x67).

## 12.3.3.4 4 Channel Analog Input Modules for RTD's

750-450

Table 322: 4 Channel Analog Input Modules for RTD's

| Two is 522. Fertamines in pur interval of the s |           |             |                          |  |  |  |  |  |
|---|-----------|-------------|--------------------------|--|--|--|--|--|
| Input Process Image                             |           |             |                          |  |  |  |  |  |
| T4  | Byte      | Description |                          |  |  |  |  |  |
| Instance  | High Byte | Low Byte    | Description              |  |  |  |  |  |
| n   | D1        | D0          | Measured Value Channel 1 |  |  |  |  |  |
| n+1   | D3        | D2          | Measured Value Channel 2 |  |  |  |  |  |
| n+2   | D5        | D4          | Measured Value Channel 3 |  |  |  |  |  |
| n+3   | D7        | D6          | Measured Value Channel 4 |  |  |  |  |  |

The input modules represent 4x2 bytes and seize 4 Instances in Class (0x67).

### 12.3.3.5 3-Phase Power Measurement Module

750-493

The above Analog Input Modules have a total of 9 bytes of user data in both the Input and Output Process Image (6 bytes of data and 3 bytes of control/status). The following tables illustrate the Input and Output Process Image, which has a

total of 6 words mapped into each image. Word alignment is applied.

Table 323: 3-Phase Power Measurement Module

| Input Process Image |           |             |                   |
|---------------------|-----------|-------------|-------------------|
| Instance            | Byte l    | Destination | D                 |
| Instance            | High Byte | Low Byte    | Description       |
|                     | -         | S0          | Status byte 0     |
| n                   | D1        | D0          | Input data word 1 |
| n+1                 | -         | S1          | Status byte 1     |
| II⊤1                | D3        | D2          | Input data word 2 |
| n+2                 | -         | S2          | Status byte 2     |
|                     | D5        | D4          | Input data word 3 |

The input modules represent 3x4 bytes and seize 3 Instances in Class (0x67).

| <b>Output Proce</b> | Output Process Image |          |                    |  |
|---------------------|----------------------|----------|--------------------|--|
| Instance            | Byte Destination     |          | Description        |  |
| Instance            | High Byte            | Low Byte | Description        |  |
| -                   | -                    | C0       | Control byte 0     |  |
| n                   | D1                   | D0       | Output data word 1 |  |
| 1                   | -                    | C1       | Control byte 1     |  |
| n+1                 | D3                   | D2       | Output data word 2 |  |
|                     | -                    | C2       | Control byte 2     |  |
| n+2                 | D5                   | D4       | Output data word 3 |  |

The input modules represent 3x4 bytes and seize 3 Instances in Class (0x68).

## 12.3.3.6 8 Channel Analog Input Modules

750-451

Table 324: 8 Channel Analog Input Modules for RTD's

| Input Process Image |                  |          |                          |
|---------------------|------------------|----------|--------------------------|
| T .                 | Byte Destination |          | Description              |
| Instance            | High Byte        | Low Byte | Description              |
| n                   | D1               | D0       | Measured Value Channel 1 |
| n+1                 | D3               | D2       | Measured Value Channel 2 |
| n+2                 | D5               | D4       | Measured Value Channel 3 |
| n+3                 | D7               | D6       | Measured Value Channel 4 |
| n+4                 | D9               | D8       | Measured Value Channel 5 |
| n+5                 | D11              | D10      | Measured Value Channel 6 |
| n+6                 | D13              | D12      | Measured Value Channel 7 |
| n+7                 | D15              | D14      | Measured Value Channel 8 |

The input modules represent 8x2 bytes and seize 8 Instances in Class (0x67).

## 12.3.4 Analog Output Modules

The hardware of an analog output module has 16 bits of measured analog data per channel and 8 bits of control/status. However, the coupler/controller with EtherNet/IP does not have access to the 8 control/status bits. Therefore, the coupler/controller with EtherNet/IP can only access the 16 bits of analog data per

channel, which are grouped as words and mapped in Intel format in the Output Process Image.

When digital output modules are also present in the node, the analog output data is always mapped into the Output Process Image in front of the digital data.

Each output channel seizes one Instance in the Analog Output Point Object (Class 0x68).

## Information

## Information to the structure of the Control/Status byte

For detailed information about the structure of a particular module's control/status byte, please refer to that module's manual. Manuals for each module can be found on the Internet under: http://www.wago.com.

#### 12.3.4.1 2 Channel Analog Output Modules

750-550, -552, -554, -556, -560, -562, 563, -585, (and all variations), 753-550, -552, -554, -556

Table 325: 2 Channel Analog Output Modules

| Output Process Image |           |            |                        |  |
|----------------------|-----------|------------|------------------------|--|
| T4                   | Byte D    | estination | D : 4                  |  |
| Instance             | High Byte | Low Byte   | Description            |  |
| n                    | D1        | D0         | Output Value Channel 1 |  |
| n+1                  | D3        | D2         | Output Value Channel 2 |  |

The output modules represent 2x2 bytes and seize 2 Instances in Class (0x68).

#### 12.3.4.2 **4 Channel Analog Output Modules**

750-553, -555, -557, -559, 753-553, -555, -557, -559

Table 326: 4 Channel Analog Output Modules

| Output Process Image |                  |          |                        |  |
|----------------------|------------------|----------|------------------------|--|
| T .                  | Byte Destination |          | Description            |  |
| Instance             | High Byte        | Low Byte | Description            |  |
| n                    | D1               | D0       | Output Value Channel 1 |  |
| n+1                  | D3               | D2       | Output Value Channel 2 |  |
| n+2                  | D5               | D4       | Output Value Channel 3 |  |
| n+3                  | D7               | D6       | Output Value Channel 4 |  |

The output modules represent 4x2 bytes and seize 4 Instances in Class (0x68).

## 12.3.4.3 8 Channel Analog Output Modules

Table 327: 8 Channel Analog Output Modules

| Output Process Image |           |             |                        |
|----------------------|-----------|-------------|------------------------|
| Instance             | Byte I    | Destination | Description            |
| instance             | High Byte | Low Byte    | Description            |
| n                    | D1        | D0          | Output Value Channel 1 |
| n+1                  | D3        | D2          | Output Value Channel 2 |
| n+2                  | D5        | D4          | Output Value Channel 3 |
| n+3                  | D7        | D6          | Output Value Channel 4 |
| n+4                  | D9        | D8          | Output Value Channel 5 |
| n+5                  | D11       | D10         | Output Value Channel 6 |
| n+6                  | D13       | D12         | Output Value Channel 7 |
| n+7                  | D15       | D14         | Output Value Channel 8 |

The output modules represent 8x2 bytes and seize 8 Instances in Class (0x68).

#### 12.3.5 **Specialty Modules**

WAGO has a host of Specialty I/O modules that perform various functions. With individual modules beside the data bytes also the control/status byte is mapped in the process image. The control/status byte is required for the bidirectional data exchange of the module with the higher-ranking control system. The control byte is transmitted from the control system to the module and the status byte from the module to the control system.

This allows, for example, setting of a counter with the control byte or displaying of overshooting or undershooting of the range with the status byte.

The control/status byte always lies in the low byte for the fieldbus coupler/controller with Ethernet/IP.

## Information

## Information to the structure of the Control/Status byte

For detailed information about the structure of a particular module's control/status byte, please refer to that module's manual. Manuals for each module can be found on the Internet under: http://www.wago.com.

The Specialty Modules represent as analog modules.

For this, the process input data of the Specialty Modules seize one Instance per channel in the Analog Input Point Object (Class 0x67) and the process output data seize one Instance seize one Instance in the Analog Input Point Object (Class 0x67) per channel in the Analog Output Point Object (Class 0x68).

#### 12.3.5.1 **Counter Modules**

750-404, (and all variations except of /000-005), 753-404, (and variation /000-003)

The above Counter Modules have a total of 5 bytes of user data in both the Input and Output Process Image (4 bytes of counter data and 1 byte of control/status). The counter value is supplied as 32 bits. The following tables illustrate the Input and Output Process Image, which has a total of 3 words mapped into each image. Word alignment is applied.

Table 328: Counter Modules 750-404, (and all variations except of /000-005), 753-404, (and variation /000-003)

| Input Process Image |                  |          |               |  |
|---------------------|------------------|----------|---------------|--|
| Instance            | Byte Destination |          | Description   |  |
| Instance            | High Byte        | Low Byte | Description   |  |
|                     | -                | S        | Status byte   |  |
| n                   | D1               | D0       | Country value |  |
|                     | D3               | D2       | Counter value |  |

The specialty modules represent 1x6 bytes input data and seize 1 Instance in Class (0x67).

| Output Process Image |                  |          |                         |  |
|----------------------|------------------|----------|-------------------------|--|
| Instance             | Byte Destination |          | Demonstration.          |  |
|                      | High Byte        | Low Byte | Description             |  |
|                      | -                | С        | Control byte            |  |
| n                    | D1               | D0       | Country setting realise |  |
|                      | D3               | D2       | Counter setting value   |  |

And the specialty modules represent 1x6 bytes output data and seize 1 Instance in Class (0x68).

### 750-404/000-005

The above Counter Modules have a total of 5 bytes of user data in both the Input and Output Process Image (4 bytes of counter data and 1 byte of control/ status). The two counter values are supplied as 16 bits. The following tables illustrate the Input and Output Process Image, which has a total of 3 words mapped into each image. Word alignment is applied.

Table 329: Counter Modules 750-404/000-005

| <b>Input Pro</b> | Input Process Image |          |                            |  |  |
|------------------|---------------------|----------|----------------------------|--|--|
| Instance         | Byte Destination    |          | Demonstration              |  |  |
|                  | High Byte           | Low Byte | Description                |  |  |
|                  | -                   | S        | Status byte                |  |  |
| n                | D1                  | D0       | Counter Value of Counter 1 |  |  |
|                  | D3                  | D2       | Counter Value of Counter 2 |  |  |

The specialty modules represent 2x3 bytes input data and seize 2 Instances in Class (0x67).

| Output Pi | rocess Image     |          |                                    |
|-----------|------------------|----------|------------------------------------|
| Instance  | Byte Destination |          | Description                        |
| Instance  | High Byte        | Low Byte | Description                        |
|           | -                | С        | Control byte                       |
| n         | D1               | D0       | Counter Setting Value of Counter 1 |
|           | D3               | D2       | Counter Setting Value of Counter 2 |

And the specialty modules represent 1x6 bytes output data and seize 1 Instance in Class (0x68).

750-638, 753-638

The above Counter Modules have a total of 6 bytes of user data in both the Input and Output Process Image (4 bytes of counter data and 2 bytes of control/status). The two counter values are supplied as 16 bits. The following tables illustrate the Input and Output Process Image, which has a total of 4 words mapped into each image. Word alignment is applied.

Table 330: Counter Modules 750-638, 753-638

| <b>Input Pro</b> | Input Process Image |          |                             |  |
|------------------|---------------------|----------|-----------------------------|--|
| Instance         | Byte Destination    |          | Description                 |  |
| Instance         | High Byte           | Low Byte | Description                 |  |
|                  | -                   | S0       | Status byte von Counter 1   |  |
| n                | D1                  | D0       | Counter Value von Counter 1 |  |
| n+1              | -                   | S1       | Status byte von Counter 2   |  |
|                  | D3                  | D2       | Counter Value von Counter 2 |  |

The specialty modules represent 2x3 bytes input data and seize 2 Instances in Class (0x67).

| Output Process Image |                  |          |                                     |
|----------------------|------------------|----------|-------------------------------------|
| Instance             | Byte Destination |          | Description                         |
|                      | High Byte        | Low Byte | Description                         |
|                      | -                | C0       | Control byte von Counter 1          |
| n                    | D1               | D0       | Counter Setting Value von Counter 1 |
| m   1                | -                | C1       | Control byte von Counter 2          |
| n+1                  | D3               | D2       | Counter Setting Value von Counter 2 |

And the specialty modules represent 2x3 bytes output data and seize 2 Instances in Class (0x68).

#### 12.3.5.2 **Pulse Width Modules**

750-511, (and all variations /xxx-xxx)

The above Pulse Width modules have a total of 6 bytes of user data in both the Input and Output Process Image (4 bytes of channel data and 2 bytes of control/ status). The two channel values are supplied as 16 bits. Each channel has its own control/status byte. The following table illustrates the Input and Output Process Image, which has a total of 4 words mapped into each image. Word alignment is applied.

Table 331: Pulse Width Modules 750-511, /xxx-xxx

| Input and | <b>Output Process</b> |            |                                  |
|-----------|-----------------------|------------|----------------------------------|
| Instance  | Byte D                | estination | Description                      |
| Instance  | High Byte             | Low Byte   | Description                      |
|           | 1                     | C0/S0      | Control/Status byte of Channel 1 |
| n         | D1                    | D0         | Data Value of Channel 1          |
| l 1       |                       |            | Control/Status byte of Channel 2 |
| n+1       | D3                    | D2         | Data Value of Channel 2          |

The specialty modules represent 2x3 bytes input and output data and seize 2 Instances in Class (0x67) and 2 Instances in Class (0x68).

## 12.3.5.3 Serial Interface Modules with alternative Data Format

750-650, (and the variations /000-002, -004, -006, -009, -010, -011, -012, -013), 750-651, (and the variations /000-002, -003), 750-653, (and the variations /000-002, -007), 753-650, -653

## Note

# The process image of the / 003-000-variants depends on the parameterized operating mode!

With the freely parametrizable variations /003 000 of the serial interface modules, the desired operation mode can be set. Dependent on it, the process image of these modules is then the same, as from the appropriate variation.

The above Serial Interface Modules with alternative data format have a total of 4 bytes of user data in both the Input and Output Process Image (3 bytes of serial data and 1 byte of control/status). The following table illustrates the Input and Output Process Image, which have a total of 2 words mapped into each image. Word alignment is applied.

Table 332: Serial Interface Modules with alternative Data Format

| Input and Output Process Image |           |                             |           |                        |  |
|--------------------------------|-----------|-----------------------------|-----------|------------------------|--|
| Instance                       | Byte D    | Doggar                      | intion    |                        |  |
| Instance                       | High Byte | h Byte Low Byte Description |           | триоп                  |  |
| n                              | D0        | C/S                         | Data byte | Control/status<br>byte |  |
| n+1                            | D2        | D1                          | Data      | bytes                  |  |

The specialty modules represent 2x2 bytes input and output data and seize 2 Instances in Class (0x67) and 2 Instances in Class (0x68).

## 12.3.5.4 Serial Interface Modules with Standard Data Format

750-650/000-001, -014, -015, -016 750-651/000-001 750-653/000-001, -006

The above Serial Interface Modules with Standard Data Format have a total of 6 bytes of user data in both the Input and Output Process Image (5 bytes of serial data and 1 byte of control/status). The following table illustrates the Input and Output Process Image, which have a total of 3 words mapped into each image. Word alignment is applied.

Table 333: Serial Interface Modules with Standard Data Format

| Input and Output Process Image |           |             |             |                        |  |
|--------------------------------|-----------|-------------|-------------|------------------------|--|
| Instance                       | Byte I    | Destination | Dagas       | ···· 4: a              |  |
| Instance                       | High Byte | Low Byte    | Description |                        |  |
|                                | D0        | C/S         | Data byte   | Control/status<br>byte |  |
| n                              | D2        | D1          | Data        | 1-4                    |  |
|                                | D4        | D3          | Data        | Data bytes             |  |

The specialty modules represent 1x6 bytes input and output data and seize 1 Instance in Class (0x67) and 1 Instance in Class (0x68).

#### 12.3.5.5 **Data Exchange Module**

750-654, (and the variation /000-001)

The Data Exchange modules have a total of 4 bytes of user data in both the Input and Output Process Image. The following tables illustrate the Input and Output Process Image, which has a total of 2 words mapped into each image. Word alignment is applied.

Table 334: Data Exchange Module

| Input and | Input and Output Process Image |          |             |  |  |  |
|-----------|--------------------------------|----------|-------------|--|--|--|
| I4        | Byte Destination               |          |             |  |  |  |
| Instance  | High Byte                      | Low Byte | Description |  |  |  |
| n         | D1                             | D0       | Data hadaa  |  |  |  |
| n+1       | D3                             | D2       | Data bytes  |  |  |  |

The specialty modules represent 2x2 bytes input and output data and seize 2 Instances in Class (0x67) and 2 Instances in Class (0x68).

#### 12.3.5.6 **SSI Transmitter Interface Modules**

750-630, (and all variations)

## Note

## The process image of the / 003-000-variants depends on the parameterized operating mode!

The operating mode of the configurable /003-000 I/O module versions can be set. Based on the operating mode, the process image of these I/O modules is then the same as that of the respective version.

The above SSI Transmitter Interface modules have a total of 4 bytes of user data in the Input Process Image, which has 2 words mapped into the image. Word alignment is applied.

Table 335: SSI Transmitter Interface Modules

| <b>Input Pro</b>             | Input Process Image |          |             |  |  |
|------------------------------|---------------------|----------|-------------|--|--|
| Byte Destination Description |                     |          |             |  |  |
| Instance                     | High Byte           | Low Byte | Description |  |  |
| n                            | D1                  | D0       | Data hataa  |  |  |
| n+1                          | D3                  | D2       | Data bytes  |  |  |

The specialty modules represent 2x2 bytes input data and seize 2 Instances in Class (0x67).

750-630/000-004, -005, -007

In the input process image, SSI transmitter interface modules with status occupy 5 usable bytes, 4 data bytes, and 1 additional status byte. A total of 3 words are assigned in the process image via word alignment.

Table 336: SSI Transmitter Interface I/O Modules with an Alternative Data Format

| <b>Input Pro</b> | Input Process Image     |        |             |             |       |
|------------------|-------------------------|--------|-------------|-------------|-------|
| Instance         | Byte D                  | Doggan | Description |             |       |
| Instance         | nce High Byte High Byte |        |             |             | Descr |
|                  | -                       | S      | not used    | Status byte |       |
| n                | D1                      | D0     | Data bytes  |             |       |
|                  | D3                      | D2     |             |             |       |

The specialty modules represent 1x6 bytes and seize 1 Instance in Class (0x67).

#### 12.3.5.7 **Incremental Encoder Interface Modules**

750-631/000-004, -010, -011

The above Incremental Encoder Interface modules have 5 bytes of input data and 3 bytes of output data. The following tables illustrate the Input and Output Process Image, which have 4 words into each image. Word alignment is applied.

Table 337: Incremental Encoder Interface Modules 750-631/000-004, -010, -011

| Input Process Image |           |                           |              |                |  |
|---------------------|-----------|---------------------------|--------------|----------------|--|
| Taratanaa           | Byte I    | e Destination Description |              | ···· 4 · · · · |  |
| Instance            | High Byte | Low Byte                  | Descr        | aption         |  |
|                     | -         | S                         | not used     | Status byte    |  |
| n                   | D1        | D0                        | Counter word |                |  |
|                     | -         | -                         | not used     |                |  |
|                     | D4        | D3                        | Latch        | word           |  |

The specialty modules represent 1x6 bytes input data and seize 1 Instance in Class (0x67).

| Output Process Image |                    |             |                                    |  |
|----------------------|--------------------|-------------|------------------------------------|--|
| Inchance             | Byte De            | estination  | Description                        |  |
| Instance             | High Byte Low Byte | Description |                                    |  |
|                      | -                  | C           | Control byte of counter 1          |  |
|                      | D1                 | D0          | Counter setting value of counter 1 |  |
| n                    | -                  | -           | not used                           |  |
|                      | -                  | -           | not used                           |  |

And the specialty modules represent 1x6 bytes output data and seize 1 Instance in Class (0x68).

### 750-634

The above Incremental Encoder Interface module has 5 bytes of input data (6 bytes in cycle duration measurement mode) and 3 bytes of output data. The following tables illustrate the Input and Output Process Image, which has 4 words mapped into each image. Word alignment is applied.

Table 338: Incremental Encoder Interface Modules 750-634

| <b>Input Pro</b> | Input Process Image |            |             |                 |  |  |
|------------------|---------------------|------------|-------------|-----------------|--|--|
| Instance         | Byte D              | estination | Dogge       | uintian         |  |  |
| Instance         | High Byte           | Low Byte   | Description |                 |  |  |
|                  | -                   | S          | not used    | Status byte     |  |  |
| _ [              | D1                  | D0         | Count       | er word         |  |  |
| n                | -                   | (D2) *)    | not used    | (Periodic time) |  |  |
|                  | D4                  | D3         | Latel       | n word          |  |  |

<sup>\*)</sup> If cycle duration measurement mode is enabled in the control byte, the cycle duration is given as a 24-bit value that is stored in D2 together with D3/D4.

The specialty modules represent 1x8 bytes input data and seize 1 Instance in Class (0x67).

| Output Process Image |           |          |             |              |  |
|----------------------|-----------|----------|-------------|--------------|--|
| Byte Destination     |           |          |             |              |  |
| Instance             | High Byte | Low Byte | Description |              |  |
|                      | -         | C        | not used    | Control byte |  |
|                      | D1        | D0       | Counter s   | etting word  |  |
| n                    | -         | -        |             |              |  |
|                      | -         | -        | not         | not used     |  |

And the specialty modules represent 1x8 bytes output data and seize 1 Instance in Class (0x68).

### 750-637

The above Incremental Encoder Interface Module has a total of 6 bytes of user data in both the Input and Output Process Image (4 bytes of encoder data and 2 bytes of control/status). The following table illustrates the Input and Output Process Image, which have 4 words mapped into each image. Word alignment is applied.

Table 339: Incremental Encoder Interface Modules 750-637

| Input and Output Process Image |           |            |                                  |  |
|--------------------------------|-----------|------------|----------------------------------|--|
| Instance                       | Byte D    | estination | Description                      |  |
| Instance                       | High Byte | Low Byte   | Description                      |  |
|                                | -         | C0/S0      | Control/Status byte of Channel 1 |  |
| n                              | D1        | D0         | Data Value of Channel 1          |  |
| 1                              | -         | C1/S1      | Control/Status byte of Channel 2 |  |
| n+1                            | D3        | D2         | Data Value of Channel 2          |  |

The specialty modules represent 2x3 bytes input and output data and seize 2 Instances in Class (0x67) and 2 Instances in Class (0x68).

750-635, 753-635

The above Digital Pulse Interface module has a total of 4 bytes of user data in both the Input and Output Process Image (3 bytes of module data and 1 byte of control/status). The following table illustrates the Input and Output Process Image, which have 2 words mapped into each image. Word alignment is applied.

Table 340: Incremental Encoder Interface Modules 750-635, 750-635

| Input and Output Process Image        |           |          |           |                        |  |
|---------------------------------------|-----------|----------|-----------|------------------------|--|
| Instance Byte Destination Description |           |          |           |                        |  |
| Instance                              | High Byte | Low Byte | Desci     | ription                |  |
| n                                     | D0        | C0/S0    | Data byte | Control/status<br>byte |  |
|                                       | D2        | D1       | Data      | bytes                  |  |

The specialty modules represent 1x4 bytes input and output data and seize 1 Instance in Class (0x67) and 1 Instance in Class (0x68).

### 12.3.5.8 DC-Drive Controller

750-636

The DC-Drive Controller maps 6 bytes into both the input and output process image. The data sent and received are stored in up to 4 input and output bytes (D0 ... D3). Two control bytes (C0, C1) and two status bytes (S0/S1) are used to control the I/O module and the drive.

In addition to the position data in the input process image (D0 ... D3), it is possible to display extended status information (S2 ... S5). Then the three control bytes (C1 ... C3) and status bytes (S1 ... S3) are used to control the data flow.

Bit 3 of control byte C1 (C1.3) is used to switch between the process data and the extended status bytes in the input process image (Extended Info\_ON). Bit 3 of status byte S1 (S1.3) is used to acknowledge the switching process.

Table 341: DC-Drive Controller 750-636

| Input Process Image |              |                  |   |  |  |
|---------------------|--------------|------------------|---|--|--|
| Tuetanas            | Byte I       | Byte Destination |   |  |  |
| Instance            | High Byte    | Low Byte         | Descr   | ription  |  |
|                     | S1           | S0               | Status byte S1  | Status byte S0                                     |  |
| n                   | D1*) / S3**) | D0*) / S2**)     | Actual position*) / Extended status byte S3**)              | Actual position (LSB) / Extended status byte S2**) |  |
| n                   | D3*) / S5**) | D2*) / S4**)     | Actual position<br>(MSB) /<br>Extended status<br>byte S3**) | Actual position*) / Extended status byte S4**)     |  |

<sup>\*)</sup> ExtendedInfo ON = '0'.

<sup>\*\*)</sup> ExtendedInfo\_ON = '1'.

| Output Process Image |                    |    |                         |                         |  |
|----------------------|--------------------|----|-------------------------|-------------------------|--|
| T4                   | Byte Destination   |    | Description             |                         |  |
| Instance             | High Byte Low Byte |    | Descr                   | aption                  |  |
|                      | C1                 | C0 | Control byte C1         | Control byte C0         |  |
| n                    | D1                 | D0 | Setpoint position       | Setpoint position (LSB) |  |
| _                    | D3                 | D2 | Setpoint position (MSB) | Setpoint position       |  |

The specialty modules represent 1x6 bytes input and output data and seize 1 Instance in Class (0x67) and 1 Instance in Class (0x68).

#### 12.3.5.9 Steppercontroller

750-670

The Steppercontroller RS422 / 24 V / 20 mA 750-670 provides the fieldbus coupler 12 bytes input and output process image via 1 logical channel. The data to be sent and received are stored in up to 7 output bytes (D0 ... D6) and 7 input bytes (D0 ... D6), depending on the operating mode.

Output byte D0 and input byte D0 are reserved and have no function assigned.

One I/O module control and status byte (C0, S0) and 3 application control and status bytes (C1 ... C3, S1 ... S3) provide the control of the data flow.

Switching between the two process images is conducted through bit 5 in the control byte (C0 (C0.5). Activation of the mailbox is acknowledged by bit 5 of the status byte S0 (S0.5).

Table 342: Steppercontroller RS 422 / 24 V / 20 mA 750-670

| Input Process Image |           |             |                             |                              |
|---------------------|-----------|-------------|-----------------------------|------------------------------|
| T4                  | Byte I    | Destination | Dagas                       |                              |
| Instance            | High Byte | Low Byte    | Descr                       | ription                      |
|                     | reserved  | S0          | reserved                    | Status byte S0               |

<sup>\*)</sup> Cyclic process image (Mailbox disabled)

The specialty modules represent 1x12 bytes input and output data and seize 1 Instance in Class (0x67) and 1 Instance in Class (0x68).

## 12.3.5.10 RTC Module

750-640

The RTC Module has a total of 6 bytes of user data in both the Input and Output Process Image (4 bytes of module data and 1 byte of control/status and 1 byte ID for command). The following table illustrates the Input and Output Process Image, which have 3 words mapped into each image. Word alignment is applied.

Table 343: RTC Module 750-640

| Input and | Output Process Image |             |              |                        |
|-----------|----------------------|-------------|--------------|------------------------|
| T4        | Byte I               | Destination | D            |                        |
| Instance  | High Byte            | Low Byte    | Descri       | ption                  |
|           | ID                   | C/S         | Command byte | Control/status<br>byte |
| n         | D1                   | D0          | Dote 1       |                        |
|           | D3                   | D2          | Data l       | bytes                  |

The specialty modules represent 1x6 bytes input data and seize 1 Instance in Class (0x67) and seize 1 Instance in Class (0x68).

<sup>\*\*)</sup> Mailbox process image (Mailbox activated)

### 12.3.5.11 DALI/DSI Master Module

750-641

The DALI/DSI Master module has a total of 6 bytes of user data in both the Input and Output Process Image (5 bytes of module data and 1 byte of control/status). The following tables illustrate the Input and Output Process Image, which have 3 words mapped into each image. Word alignment is applied.

Table 344: DALI/DSI Master module 750-641

| Input Process Image |           |            |                      |              |  |
|---------------------|-----------|------------|----------------------|--------------|--|
| Instance            | Byte D    | estination | Dogow                | intion       |  |
| Instance            | High Byte | Low Byte   | Low Byte Description |              |  |
|                     | D0        | S          | DALI Response        | Status byte  |  |
| n                   | D2        | D1         | Message 3            | DALI Address |  |
|                     | D4        | D3         | Message 1            | Message 2    |  |

The specialty modules represent 1x6 bytes input data and seize 1 Instance in Class (0x67).

| Output Process Image |           |            |                                    |              |
|----------------------|-----------|------------|------------------------------------|--------------|
| Instance             | Byte Do   | estination | Decement                           |              |
| Instance             | High Byte | Low Byte   | Description                        |              |
|                      | D0        | С          | DALI command,<br>DSI dimming value | Control byte |
| n                    | D2        | D1         | Parameter 2                        | DALI Address |
|                      | D4        | D3         | Command extension                  | Parameter 1  |

And the specialty modules represent 1x6 bytes output data and seize 1 Instance in Class (0x68).

### 12.3.5.12 EnOcean Radio Receiver

750-642

The EnOcean radio receiver has a total of 4 bytes of user data in both the Input and Output Process Image (3 bytes of module data and 1 byte of control/status). The following tables illustrate the Input and Output Process Image, which have 2 words mapped into each image. Word alignment is applied.

Table 345: EnOcean Radio Receiver 750-642

| Input Process Image          |           |          |                       |  |  |
|------------------------------|-----------|----------|-----------------------|--|--|
| Byte Destination Description |           |          |                       |  |  |
| Instance                     | High Byte | Low Byte | Description           |  |  |
| n                            | D0        | S        | Data byte Status byte |  |  |
| n+1                          | D2        | D1       | Data bytes            |  |  |

| Output Process Image |           |          |                       |  |  |
|----------------------|-----------|----------|-----------------------|--|--|
| Byte Destination     |           |          |                       |  |  |
| Instance             | High Byte | Low Byte | Description           |  |  |
| n                    | -         | С        | not used Control byte |  |  |
| n+1                  | -         | -        | not used              |  |  |

The specialty modules represent 2x2 bytes input and output data and seize 2 Instances in Class (0x67) and 2 Instances in Class (0x68).

## 12.3.5.13 MP Bus Master Module

750-643

The MP Bus Master Module has a total of 8 bytes of user data in both the Input and Output Process Image (6 bytes of module data and 2 bytes of control/status). The following table illustrates the Input and Output Process Image, which have 4 words mapped into each image. Word alignment is applied.

Table 346: MP Bus Master Module 750-643

| Input and Output Process Image |           |                  |                                     |                        |  |
|--------------------------------|-----------|------------------|-------------------------------------|------------------------|--|
| T                              | Byte      | Byte Destination |                                     |                        |  |
| Instance                       | High Byte | Low Byte         | Desci                               | ription                |  |
|                                | C1/S1     | C0/S0            | extended<br>Control/<br>Status byte | Control/status<br>byte |  |
| n                              | D1        | D0               |                                     |                        |  |
|                                | D3        | D2               | Data                                | bytes                  |  |
|                                | D5        | D4               |                                     |                        |  |

The specialty modules represent 1x8 bytes input and output data and seize 1 Instance in Class (0x67) and 1 Instance in Class (0x68).

## 12.3.5.14 Bluetooth® RF-Transceiver

750-644

The size of the process image for the *Bluetooth*<sup>®</sup> module can be adjusted to 12, 24 or 48 bytes.

It consists of a control byte (input) or status byte (output); an empty byte; an overlayable mailbox with a size of 6, 12 or 18 bytes (mode 2); and the *Bluetooth*® process data with a size of 4 to 46 bytes.

Thus, each *Bluetooth*<sup>®</sup> module uses between 12 and 48 bytes in the process image. The sizes of the input and output process images are always the same.

The first byte contains the control/status byte; the second contains an empty byte.

Process data attach to this directly when the mailbox is hidden. When the mailbox is visible, the first 6, 12 or 18 bytes of process data are overlaid by the mailbox data, depending on their size. Bytes in the area behind the optionally visible mailbox contain basic process data. The internal structure of the *Bluetooth*® process data can be found in the documentation for the *Bluetooth*® 750-644 RF Transceiver.

The mailbox and the process image sizes are set with the startup tool WAGO-I/O-*CHECK*.

Table 347: Bluetooth® RF-Transceiver 750-644

| Input and Output Process Image |                  |          |  |              |  |
|--------------------------------|------------------|----------|--|--------------|--|
| T 4                            | Byte Destination |          | D  |              |  |
| Instance                       | High Byte        | Low Byte | Desci  | ription      |  |
|                                | -                | C0/S0    | not used Control/status                                    |              |  |
|                                | D1               | D0       | Mailbox (0, 3, 6 or 9 words) and Process data (2-23 words) |              |  |
| n                              | D3               | D2       |  |              |  |
|                                | D5               | D4       |  |              |  |
|                                |                  |          | Trocess data   | (2-23 words) |  |
|                                | D45              | D44      |  |              |  |

The 750-644 constitutes a special module, whose process data (12, 24 or 48 bytes) occupy on instances in classes 0x67 and 0x68.

## 12.3.5.15 Vibration Velocity/Bearing Condition Monitoring VIB I/O

750-645

The Vibration Velocity/Bearing Condition Monitoring VIB I/O has a total of 12 bytes of user data in both the Input and Output Process Image (8 bytes of module data and 4 bytes of control/status). The following table illustrates the Input and Output Process Image, which have 8 words mapped into each image. Word alignment is applied.

Table 348: Vibration Velocity/Bearing Condition Monitoring VIB I/O 750-645

| Input and Output Process Image |                                     |       |  |  |  |  |
|--------------------------------|-------------------------------------|-------|--|--|--|--|
| Instance                       | Byte Destination High Byte Low Byte |       | Description  |  |  |  |
|                                | -<br>-                              | C0/S0 | not used  Control/status byte (log. Channel 1, Sensor inp  |  |  |  |
| n                              | D1                                  | D0    | Data bytes (log. Channel 1, Sensor input 1)                |  |  |  |
| n+1                            | -                                   | C1/S1 | not used   | Control/status byte (log. Channel 2, Sensor input 2) |  |  |
|                                | D3                                  | D2    | Data bytes (log. Channel 2, Sensor input 2)                |  |  |  |
| L 2                            | -                                   | C2/S2 | not used Control/status byte (log. Channel 3, Sensor input |  |  |  |
| n+2                            | D5                                  | D4    | Data bytes (log. Channel 3, Sensor input 3)                |  |  |  |
| n+3                            | -                                   | C3/S3 | not used Control/status byte (log. Channel 4, Sensor input |  |  |  |
|                                | D7                                  | D6    | Data bytes (log. Channel 4, Sensor input 2)                |  |  |  |

The specialty modules represent 4x3 bytes input and output data and seize 4 Instances in Class (0x67) and 4 Instances in Class (0x68).

### 12.3.5.16 AS-interface Master Module

superimposed (Mode 1).

750-655

The length of the process image of the AS-interface master module can be set to fixed sizes of 12, 20, 24, 32, 40 or 48 bytes.

It consists of a control or status byte, a mailbox with a size of 0, 6, 10, 12 or 18 bytes and the AS-interface process data, which can range from 0 to 32 bytes.

The AS-interface master module has a total of 6 to maximally 24 words data in both the Input and Output Process Image. Word alignment is applied.

The first Input and output word, which is assigned to an AS-interface master module, contains the status / control byte and one empty byte. Subsequently the mailbox data are mapped, when the mailbox is permanently

In the operating mode with suppressible mailbox (Mode 2), the mailbox and the cyclical process data are mapped next.

The following words contain the remaining process dat.

The mailbox and the process image sizes are set with the startup tool WAGO-I/O-*CHECK*.

Table 349: AS-interface Master module 750-655

| Input and Output Process Image |           |             |   |                        |  |  |
|--------------------------------|-----------|-------------|---|------------------------|--|--|
| T .                            | Byte I    | Destination | Description   |                        |  |  |
| Instance                       | High Byte | Low Byte    |   |                        |  |  |
|                                | -         | C0/S0       | not used  | Control/status<br>byte |  |  |
|                                | D1        | D0          | Mailbox (0, 3, 5, 6 or 9 words) Process data (0-16 words) |                        |  |  |
| n                              | D3        | D2          |   |                        |  |  |
|                                | D5        | D4          |   |                        |  |  |
|                                |           |             | 1 Tocess data   | (0-10 words)           |  |  |
|                                | D45       | D44         |   |                        |  |  |

The specialty modules represent 1x 12...48 bytes input and output data and seize 1 Instance in Class (0x67) and 1 Instance in Class (0x68).

#### 12.3.6 System Modules

#### 12.3.6.1 **System Modules with Diagnostics**

750-610, -611

The modules provide 2 bits of diagnostics in the Input Process Image for monitoring of the internal power supply.

Table 350: System Modules with Diagnostics 750-610, -611

| Input Process Image |       |       |       |       |       |                       |                       |
|---------------------|-------|-------|-------|-------|-------|-----------------------|-----------------------|
| Bit 7               | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1                 | Bit 0                 |
|                     |       |       |       |       |       | Diagnostic<br>bit S 2 | Diagnostic<br>bit S 1 |
|                     |       |       |       |       |       | Fuse                  | Fuse                  |

The system modules seize 2 Instances in Class (0x65).

#### 12.3.6.2 **Binary Space Module**

750-622

The Binary Space Modules behave alternatively like 2 channel digital input modules or output modules and seize depending upon the selected settings 1, 2, 3 or 4 bits per channel. According to this, 2, 4, 6 or 8 bits are occupied then either in the process input or the process output image.

Table 351: Binary Space Module 750-622 (with behavior like 2 channel digital input)

| Input and Output Process Image |                    |                    |                    |                    |                    |                  |                  |
|--------------------------------|--------------------|--------------------|--------------------|--------------------|--------------------|------------------|------------------|
| Bit 7                          | Bit 6              | Bit 5              | Bit 4              | Bit 3              | Bit 2              | Bit 1            | Bit 0            |
| (Data bit<br>DI 8)             | (Data bit<br>DI 7) | (Data bit<br>DI 6) | (Data bit<br>DI 5) | (Data bit<br>DI 4) | (Data bit<br>DI 3) | Data bit<br>DI 2 | Data bit<br>DI 1 |

The Binary Space Modules seize 2, 4, 6 or 8 Instances in class (0x65) or in Class (0x66).

## 13 Application Examples

## 13.1 Test of MODBUS protocol and fieldbus nodes

You require a MODBUS master to test the function of your fieldbus node. For this purpose, various manufacturers offer a range of PC applications that you can, in part, download from the Internet as free of charge demo versions.

One of the programs which is particularly suitable to test your ETHERNET TCP/IP fieldbus node, is for instance **ModScan** from Win-Tech.

## Information

## **Additional Information**

A free of charge demo version from ModScan32 and further utilities from Win-Tech can be found in the Internet under: http://www.win-tech.com/html/demos.htm

ModScan32 is a Windows application that works as a MODBUS master.

This program allows you to access the data points of your connected ETHERNET TCP/IP fieldbus node and to proceed with the desired changes.

## Information

## **Additional Information**

For a description example relating to the software operation, refer to: <a href="http://www.win-tech.com/html/modscan32.htm">http://www.win-tech.com/html/modscan32.htm</a>

## 13.2 Visualization and Control using SCADA Software

This chapter is intended to give insight into how the WAGO ETHERNET fieldbus coupler/controller can be used for process visualization and control using standard user software.

There is a wide range of process visualization programs, called SCADA Software, from various manufacturers.

SCADA is the abbreviation for Supervisory Control and Data Acquisition.

It is a user-orientated tool used as a production information system in the areas of automation technology, process control and production monitoring.

The use of SCADA systems includes the areas of visualization and monitoring, data access, trend recording, event and alarm processing, process analysis and targeted intervention in a process (control).

The WAGO ETHERNET fieldbus node provides the required process input and output values.

## Note

# SCADA software has to provide a MODBUS device driver and support MODBUS/TCP functions!

When choosing suitable SCADA software, ensure that it provides a MODBUS device driver and supports the MODBUS/TCP functions in the coupler.

Visualization programs with MODBUS device drivers are available from i.e. Wonderware, National Instruments, Think&Do or KEPware Inc., some of which are available on the Internet as demo versions.

The operation of these programs is very specific.

However, a few essential steps are described to illustrate the way an application can be developed using a WAGO ETHERNET fieldbus node and SCADA software in principle:

- Load the MODBUS ETHERNET driver and select MODBUS ETHERNET
- 2. Enter the IP address for addressing the fieldbus node

At this point, some programs allow the user to give the node an alias name, i.e. to call the node "Measuring data". The node can then be addressed with this name.

3. Create a graphic object, such as a switch (digital) or a potentiometer (analog)

This object is displayed on the work area.

- 4. Link the object to the desired data point on the node by entering the following data:
  - Node address (IP address or alias name)
  - The desired MODBUS function codes (register/bit read/write)
  - The MODBUS address of the selected channel

Entry is program specific.

Depending on the user software the MODBUS addressing of a bus module can be represented with up to 5 digits.

## **Example of the MODBUS Addressing**

In the case of SCADA Software Lookout from National Instruments the MODBUS function codes are used with a 6 digit coding, whereby the first digit represents the MODBUS table (0, 1, 3 or 4) and implicit the function code (see following table):

| Table 3  | 52: M   | ODRUS                                   | Table a | nd Function | Codes |
|----------|---------|---|---------|-------------|-------|
| I auto 3 | JZ. IVI | ,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,, | таписа  | na runcuon  | COUCS |

| MODBUS table | MODBUS function code |   |  |
|--------------|----------------------|---|--|
| 0            | FC1 or<br>FC15       | Reading of input bits or writing of several output bits                   |  |
| 1            | FC2                  | Reading of several input bits   |  |
| 3            | FC4 or<br>FC 16      | Reading of several input registers or writing of several output registers |  |
| 4            | FC3                  | Reading of several input registers  |  |

The following five digits specify the channel number (beginning with 1) of the consecutively numbered digital or analog input and/or output channels.

### **Examples:**

Reading/writing the first digital input:

Reading/writing the second analog input:
i.e. 0 0000 1
i.e. 3 0000 2

## **Application Example:**

Thus, the digital input channel 2 of the above node "Measuring data" can be read out with the input: "Measuring data. 0 0000 2".

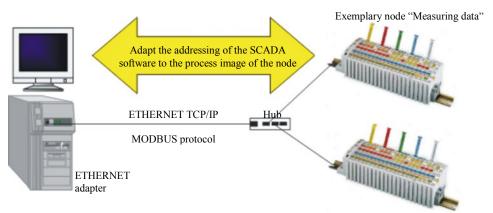

Figure 57: Example SCADA Software with MODBUS Driver

## Information

### **Additional Information**

Please refer to the respective SCADA product manual for a detailed description of the particular software operation.

## 14 Use in Hazardous Environments

The **WAGO-I/O-SYSTEM 750** (electrical equipment) is designed for use in Zone 2 hazardous areas.

The following sections include both the general identification of components (devices) and the installation regulations to be observed. The individual subsections of the "Installation Regulations" section must be taken into account if the I/O module has the required approval or is subject to the range of application of the ATEX directive.

## 14.1 Marking Configuration Examples

## 14.1.1 Marking for Europe According to ATEX and IEC-Ex

#### **Installation Regulations** 14.2

For the installation and operation of electrical equipment in hazardous areas, the valid national and international rules and regulations which are applicable at the installation location must be carefully followed.

#### Special Conditions for Safe Use (TÜV 14 ATEX 148929 X) 14.2.1

- The modules of the WAGO-I/O-SYSTEM 750-\*\*\* have to been erected in 1. such a way, that corresponding to EN 60079-15 a degree of protection of at least IP 54 according to EN 60529 is achieved.
- 2. Measures have to been taken, external to the modules, to provide a transient protection that ensures that the rated voltage, connected to the power supply terminals, is not exceeded by more than 40 %.
- The connecting and disconnecting of the non-intrinsically safe circuits is 3. only permitted if no explosive atmosphere exists. This although applies for the all switches, interfaces (Fieldbus, Ethernet, Serial) and the SD-card.
- 4. The ambient temperature range is:  $0 \, ^{\circ}\text{C} \le T_{amb} \le +60 \, ^{\circ}\text{C}$ The ambient temperature range for modules with suffix extension /025-\*\*\*\* is:  $-20 \, ^{\circ}\text{C} \le T_{amb} \le +60 \, ^{\circ}\text{C}$

# 14.2.2 Special Conditions for Safe Use (ATEX Certificate TÜV 12 ATEX 106032 X)

- 1. For use as Gc- or Dc-apparatus (in zone 2 or 22) the Field bus Independent I/O Modules WAGO-I/O-SYSTEM 750-\*\*\* Ex i shall be erected in an enclosure that fulfils the requirements of the applicable standards (see the marking) EN 60079-0, EN 60079-11, EN 60079-15 and EN 60079-31. For use as group I electrical apparatus M2 the apparatus shall be erected in an enclosure that ensures a sufficient protection according to EN 60079-0 and EN 60079-1 and the degree of protection IP64. The compliance of these requirements and the correct installation into an enclosure or a control cabinet of the devices shall be certified by an ExNB.
- 2. Measures have to be taken outside of the device that the rating voltage is not being exceeded of more than 40 % because of transient disturbances.
- 3. The connecting and disconnecting of the non-intrinsically safe circuits is only permitted during installation, for maintenance or for repair purposes. The temporal coincidence of explosion hazardous atmosphere and installation, maintenance resp. repair purposes shall be excluded.
- 4. For the type the following shall be considered: The Interface circuits shall be limited to overvoltage category I/II (non mains/mains circuits) as defined in EN 60664-1.

# 14.2.3 Special Conditions for Safe Use (IEC-Ex Certificate TUN 14.0035X)

- 1. The modules of the WAGO-I/O-SYSTEM 750-\*\*\* have to been erected in such a way, that corresponding to IEC 60079-15 a degree of protection of at least IP 54 according to IEC 60529 is achieved.
- 2. Measures have to been taken, external to the modules, to provide a transient protection that ensures that the rated voltage, connected to the power supply terminals, is not exceeded by more than 40 %.
- 3. The connecting and disconnecting of the non-intrinsically safe circuits is only permitted if no explosive atmosphere exists. This although applies for the all switches, interfaces (Fieldbus, Ethernet, Serial) and the SD-card.
- 4. The ambient temperature range is:  $0 \, ^{\circ}\text{C} \leq \text{Tamb} \leq +60 \, ^{\circ}\text{C}$ The ambient temperature range for modules with suffix extension /025-\*\*\*\* is: -20  $^{\circ}\text{C} \leq \text{Tamb} \leq +60 \, ^{\circ}\text{C}$

# 14.2.4 Special Conditions for Safe Use (IEC-Ex Certificate IECEx TUN 12.0039 X)

- 1. For use as Gc- or Dc-apparatus (in zone 2 or 22) the Field bus independent I/O Modules WAGO-I/O-SYSTEM 750-\*\*\* Ex i shall be erected in an enclosure that fulfils the requirements of the applicable standards (see the marking) IEC 60079-0, IEC 60079-11, IEC 60079-15, IEC 60079-31. For use as group I electrical apparatus M2 the apparatus shall be erected in an enclosure that ensures a sufficient protection according to IEC 60079-0 and IEC 60079-1 and the degree of protection IP64. The compliance of these requirements and the correct installation into an enclosure or a control cabinet of the devices shall be certified by an ExCB.
- 2. Measures have to be taken outside of the device that the rating voltage is not being exceeded of more than 40 % because of transient disturbances.
- 3. The connecting and disconnecting of the non-intrinsically safe circuits is only permitted during installation, for maintenance or for repair purposes. The temporal coincidence of explosion hazardous atmosphere and installation, maintenance resp. repair purposes shall be excluded.
- 4. For the type the following shall be considered: The Interface circuits shall be limited to overvoltage category I/II (non mains/mains circuits) as defined in IEC 60664-1.

# 14.2.5 Special Conditions for Safe Use according to ANSI/ISA 12.12.01

- A. "This equipment is suitable for use in Class I, Division 2, Groups A, B, C, D or non-hazardous locations only."
- B. "This equipment is to be fitted within tool-secured enclosures only."
- C. "WARNING Explosion hazard substitution of components may impair suitability for Class I, Div. 2."
- D. "WARNING Do not disconnect equipment unless power has been switched off or the area is known to be non-hazardous" has to be placed near each operator accessible connector and fuse holder.
- E. When a fuse is provided, the following information shall be provided: "A switch suitable for the location where the equipment is installed shall be provided to remove the power from the fuse."
- F. For devices with EtherCAT/Ethernet connectors "Only for use in LAN, not for connection to telecommunication circuits."
- G. "WARNING Use Module 750-642 only with antenna module 758-910."
- H. For Couplers/Controllers and Economy bus modules only: The instructions shall contain the following: "The configuration interface Service connector is for temporary connection only. Do not connect or disconnect unless the area is known to be non-hazardous. Connection or disconnection in an explosive atmosphere could result in an explosion."
- I. Modules containing fuses only: "WARNING Devices containing fuses must not be fitted into circuits subject to over loads, e.g. motor circuits."
- J. Modules containing SD card reader sockets only: "WARNING Do not connect or disconnect SD-Card while circuit is live unless the area is known to be free of ignitable concentrations of flammable gases or vapors."
- K. The modules 750-439, 750-538, 750-633, 750-663/000-003 shall only be supplied with 750-606 or 750-625/000-001.
- L. Module 750-538 only "In Hazardous Locations, Non-Incendive only when installed per Control Drawing No. 750-538".

## Information

#### **Additional Information**

Proof of certification is available on request.

Also take note of the information given on the operating and assembly instructions.

The manual, containing these special conditions for safe use, must be readily available to the user.
